Overview of this manual

About this manual

This manual contains instructions for:

- mechanical and electrical installation of the track
 - maintenance of the track
 - mechanical and electrical repair of the track.
-

Usage

This manual should be used during:

- installation, from lifting the robot to its work site and securing it to the foundation, to making it ready for operation
 - maintenance work
 - repair work and calibration.
-

Who should read this manual?

This manual is intended for:

- installation personnel
 - maintenance personnel
 - repair personnel.
-

Prerequisites

Maintenance/repair/installation personnel working with an ABB Robot must:

- be trained by ABB and have the required knowledge of mechanical and electrical installation/repair/maintenance work.
-

Organization of chapters

The manual is organized in the following chapters:

Chapter	Contents
Safety	Safety information that must be read through before performing any installation or service work on robot. Contains general safety aspects as well as more specific information on how to avoid personal injuries and damage to the product.
Installation and commissioning	Required information about lifting and installation of the track and installation of cabling. Information about how to get the system running, including information about some of the important parameters to set.
Maintenance	Step-by-step procedures that describe how to perform maintenance of the track. Based on a maintenance schedule that may be used to plan periodical maintenance.
Repair	Step-by-step procedures that describe how to perform repair activities of the track. Based on available spare parts.
Calibration	Information about calibration of the system.
Decommissioning	Environmental information about the track and its components.
Spare parts	Reference to the spare part list for the robot.

Revisions

Revision	Description
-	First edition.
A	This revision contains the following updates: <ul style="list-style-type: none">• Grease name change (Longtime PD 0 → Tribol GR 100-0 PD)• Corrected the contents on delivery. See Contents on page 59.• Added bolts to prevent carriage slipping during the transportation, which must be removed before track assembly. See Assembling sections on page 92.• Modified information of track dimensions. See Dimensions on page 76.• Modified the procedure how to shorten a long track. See Removing sections if too long on page 95.• Minor changes.
B	Published in release R16.2. The following updates are done in this revision: <ul style="list-style-type: none">• Corrected the procedures of refitting the carriage to the drive train bracket.• Added tightening torque to screws when refitting.• Corrected the screws for fastening track to base to M16x125 mm. See Hole configuration on page 87.• Added section Configuration of grease pump MEMOLUB® on page 150.• Modified the replacing procedure for linear guide. See Replacing the linear guides on page 180.• Minor changes.

Product documentation, IRC5

Categories for user documentation from ABB Robotics

The user documentation from ABB Robotics is divided into a number of categories. This listing is based on the type of information in the documents, regardless of whether the products are standard or optional.

All documents listed can be ordered from ABB on a DVD. The documents listed are valid for IRC5 robot systems.

Product manuals

Manipulators, controllers, DressPack/SpotPack, and most other hardware is delivered with a **Product manual** that generally contains:

- Safety information.
- Installation and commissioning (descriptions of mechanical installation or electrical connections).
- Maintenance (descriptions of all required preventive maintenance procedures including intervals and expected life time of parts).
- Repair (descriptions of all recommended repair procedures including spare parts).
- Calibration.
- Decommissioning.
- Reference information (safety standards, unit conversions, screw joints, lists of tools).
- Spare parts list with exploded views (or references to separate spare parts lists).
- Circuit diagrams (or references to circuit diagrams).

Technical reference manuals

The technical reference manuals describe reference information for robotics products.

- *Technical reference manual - Lubrication in gearboxes*: Description of types and volumes of lubrication for the manipulator gearboxes.
- *Technical reference manual - RAPID overview*: An overview of the RAPID programming language.
- *Technical reference manual - RAPID Instructions, Functions and Data types*: Description and syntax for all RAPID instructions, functions, and data types.
- *Technical reference manual - RAPID kernel*: A formal description of the RAPID programming language.
- *Technical reference manual - System parameters*: Description of system parameters and configuration workflows.

Continues on next page

Application manuals

Specific applications (for example software or hardware options) are described in **Application manuals**. An application manual can describe one or several applications.

An application manual generally contains information about:

- The purpose of the application (what it does and when it is useful).
- What is included (for example cables, I/O boards, RAPID instructions, system parameters, DVD with PC software).
- How to install included or required hardware.
- How to use the application.
- Examples of how to use the application.

Operating manuals

The operating manuals describe hands-on handling of the products. The manuals are aimed at those having first-hand operational contact with the product, that is production cell operators, programmers, and trouble shooters.

The group of manuals includes (among others):

- *Operating manual - Emergency safety information*
- *Operating manual - General safety information*
- *Operating manual - Getting started, IRC5 and RobotStudio*
- *Operating manual - IRC5 Integrator's guide*
- *Operating manual - IRC5 with FlexPendant*
- *Operating manual - RobotStudio*
- *Operating manual - Trouble shooting IRC5*

How to read the product manual

Reading the procedures

The procedures contain references to figures, tools, material, and so on. The references are read as described below.

References to figures

The procedures often include references to components or attachment points located on the manipulator/controller. The components or attachment points are marked with *italic text* in the procedures and completed with a reference to the figure where the current component or attachment point is shown.

The denomination in the procedure for the component or attachment point corresponds to the denomination in the referenced figure.

The table below shows an example of a reference to a figure from a step in a procedure.

	Action	Note/Illustration
8.	Remove the <i>rear attachment screws</i> , <i>gearbox</i> .	Shown in the figure Location of gearbox on page xx .

References to required equipment

The procedures often include references to equipment (spare parts, tools, etc.) required for the different actions in the procedure. The equipment is marked with *italic text* in the procedures and completed with a reference to the section where the equipment is listed with further information, that is article number and dimensions.

The designation in the procedure for the component or attachment point corresponds to the designation in the referenced list.

The table below shows an example of a reference to a list of required equipment from a step in a procedure.

	Action	Note/Illustration
3.	Fit a new <i>sealing</i> , <i>axis 2</i> to the <i>gearbox</i> .	Art. no. is specified in Required equipment on page xx .

Safety information

The manual includes a separate safety chapter that must be read through before proceeding with any service or installation procedures. All procedures also include specific safety information when dangerous steps are to be performed.

Read more in the chapter [Safety on page 15](#).

Illustrations

The robot is illustrated with general figures that does not take painting or protection type in consideration.

Likewise, certain work methods or general information that is valid for several robot models, can be illustrated with illustrations that show a different robot model than the one that is described in the current manual.

1 Safety

1.1 Introduction to safety information

Overview

The safety information in this manual is divided into the following categories:

- General safety aspects, important to attend to before performing any service work on the robot. These are applicable for all service work and are found in [*General safety information on page 16*](#).
- Safety signals and symbols shown in the manual and on the robot, warning for different types of dangers, are found in [*Safety signals and symbols on page 37*](#).
- Specific safety information, pointed out in the procedures. How to avoid and eliminate the danger is either described directly in the procedure, or in specific instructions in the section [*Safety related instructions on page 45*](#).

1 Safety

1.2.1 Introduction to general safety information

1.2 General safety information

1.2.1 Introduction to general safety information

Definitions

This section details general safety information for personnel performing installation, repair and maintenance work.

Sections

The general safety information is divided into the following sections.

Section	Examples of content
<i>Safety in the manipulator system on page 17</i>	This section describes the following: <ul style="list-style-type: none">• safety, service• limitation of liability• related information
<i>Protective stop and emergency stop on page 19</i>	This section describes protective stop and emergency stop.
<i>Safety risks on page 20</i>	This section lists dangers relevant when working with the product. The dangers are split into different categories. <ul style="list-style-type: none">• safety risks during installation or service• risks associated with live electrical parts
<i>Safety actions on page 29</i>	This section describes actions which may be taken to remedy or avoid dangers. <ul style="list-style-type: none">• fire extinguishing• safe use of the teach pendant or jogging device

1.2.2 Safety in the manipulator system

Validity and responsibility

The information does not cover how to design, install and operate a complete system, nor does it cover all peripheral equipment that can influence the safety of the entire system. To protect personnel, the complete system must be designed and installed in accordance with the safety requirements set forth in the standards and regulations of the country where the robot is installed.

The users of ABB industrial robots are responsible for ensuring that the applicable safety laws and regulations in the country concerned are observed and that the safety devices necessary to protect people working with the robot system are designed and installed correctly. Personnel working with robot must be familiar with the operation and handling of the industrial robot as described in the applicable documents, for example:

- *Operating manual - IRC5 with FlexPendant*
- *Operating manual - General safety information*¹
- *Product manual*

¹ This manual contains all safety instructions from the product manuals for the robots and the controllers.

The robot system shall be designed and constructed in such a way as to allow safe access to all areas where intervention is necessary during operation, adjustment, and maintenance.

Where it is necessary to perform tasks within the safeguarded space there shall be safe and adequate access to the task locations.

Users shall not be exposed to hazards, including slipping, tripping, and falling hazards.

Connection of external safety devices

Apart from the built-in safety functions, the robot is also supplied with an interface for the connection of external safety devices. An external safety function can interact with other machines and peripheral equipment via this interface. This means that control signals can act on safety signals received from the peripheral equipment as well as from the robot.

Limitation of liability

Any information given in this manual regarding safety must not be construed as a warranty by ABB that the industrial robot will not cause injury or damage even if all safety instructions are complied with.

1.2.2 Safety in the manipulator system

Continued

Type of information	Detailed in document	Section
Restricting the working space	<i>Product manual for the robot</i>	Installation and commissioning

1.2.3 Protective stop and emergency stop

Overview

The protective stops and emergency stops are described in the product manual for the controller.

1 Safety

1.2.4.1 Safety risks during installation and service work on robots

1.2.4 Safety risks

1.2.4.1 Safety risks during installation and service work on robots

Overview

This section includes information on general safety risks to be considered when performing installation and service work on the robot.

These safety instructions have to be read and followed by any person who deals with the installation and maintenance of the robot. Only persons who know the robot and are trained in the operation and handling of the robot are allowed to maintain the robot. Persons who are under the influence of alcohol, drugs or any other intoxicating substances are not allowed to maintain, repair, or use the robot.

General risks during installation and service

- The instructions in the product manual in the chapters *Installation and commissioning*, and *Repair* must always be followed.
- Emergency stop buttons must be positioned in easily accessible places so that the robot can be stopped quickly.
- Those in charge of operations must make sure that safety instructions are available for the installation in question.
- Those who install or service/maintain the robot must have the appropriate training for the equipment in question and in any safety matters associated with it.

Spare parts and special equipment

ABB does not supply spare parts and special equipment which have not been tested and approved by ABB. The installation and/or use of such products could negatively affect the structural properties of the robot and as a result of that affect the active or passive safety operation. ABB is not liable for damages caused by the use of non-original spare parts and special equipment. ABB is not liable for damages or injuries caused by unauthorized modifications to the robot system.

Personal protective equipment

Always use suitable personal protective equipment, based on the risk assessment for the robot installation.

Nation/region specific regulations

To prevent injuries and damages during the installation of the robot, the regulations applicable in the country concerned and the instructions of ABB Robotics must be complied with.

Non-voltage related risks

- Make sure that no one else can turn on the power to the controller and robot while you are working with the system. A good method is to always lock the main switch on the controller cabinet with a safety lock.

Continues on next page

1.2.4.1 Safety risks during installation and service work on robots

Continued

- Safety zones, which must be crossed before admittance, must be set up in front of the robot's working space. Light beams or sensitive mats are suitable devices.
- Turntables or the like should be used to keep the operator out of the robot's working space.
- If the robot is installed at a height, hanging, or other than standing directly on the floor, there may be additional risks than those for a robot standing directly on the floor.
- The axes are affected by the force of gravity when the brakes are released. In addition to the risk of being hit by moving robot parts, there is a risk of being crushed by the parallel arm (if there is one).
- Energy stored in the robot for the purpose of counterbalancing certain axes may be released if the robot, or parts thereof, are dismantled.
- When dismantling/assembling mechanical units, watch out for falling objects.
- Be aware of stored heat energy in the controller.
- Never use the robot as a ladder, which means, do not climb on the robot motors or other parts during service work. There is a serious risk of slipping because of the high temperature of the motors and oil spills that can occur on the robot.
- Never use the robot as a ladder, which means, do not climb on the manipulator motors or other parts during service work. There is a risk of the robot being damaged.

To be observed by the supplier of the complete system

When integrating the robot with external devices and machines:

- The supplier of the complete system must ensure that all circuits used in the safety function are interlocked in accordance with the applicable standards for that function.
- The supplier of the complete system must ensure that all circuits used in the emergency stop function are interlocked in a safe manner, in accordance with the applicable standards for the emergency stop function.

Complete robot

Safety risk	Description
Hot components!	 CAUTION Motors and gearboxes are HOT after running the robot! Touching motors and gearboxes may result in burns! With a higher environment temperature, more surfaces on the manipulator will get HOT and may also result in burns.

Continues on next page

1 Safety

1.2.4.1 Safety risks during installation and service work on robots

Continued

Safety risk	Description
Removed parts may result in collapse of the robot!	 WARNING Take any necessary measures to ensure that the robot does not collapse as parts are removed. For example, secure the lower arm according to the repair instruction if removing the axis-2 motor.
Removed cables to the measurement system	 WARNING If the internal cables for the measurement system have been disconnected during repair or maintenance, then the revolution counters must be updated.

Cabling

Safety risk	Description
Cable packages are sensitive to mechanical damage!	 CAUTION The cable packages are sensitive to mechanical damage. Handle the cable packages and the connectors with care in order to avoid damage.

Gearboxes and motors

Safety risk	Description
Gears may be damaged if excessive force is used!	 CAUTION Whenever parting/mating motor and gearbox, the gears may be damaged if excessive force is used!

1.2.4.2 CAUTION - Hot parts may cause burns!

1.2.4.2 CAUTION - Hot parts may cause burns!**Description**

During normal operation, many robot parts become hot, especially the drive motors and gearboxes. Sometimes areas around these parts also become hot. Touching these may cause burns of various severity.

Because of a higher environment temperature, more surfaces on the robot get hot and may result in burns.

Elimination

The following instructions describe how to avoid the dangers specified above:

	Action	Information
1	Always use your hand, at some distance, to feel if heat is radiating from the potentially hot component before actually touching it.	
2	Wait until the potentially hot component has cooled if it is to be removed or handled in any other way.	

1 Safety

1.2.4.3 Safety risks related to tools/work pieces

1.2.4.3 Safety risks related to tools/work pieces

Safe handling

It must be possible to safely turn off tools, such as milling cutters, etc. Make sure that guards remain closed until the cutters stop rotating.

It should be possible to release parts by manual operation (valves).

Safe design

Grippers/end effectors must be designed so that they retain work pieces in the event of a power failure or a disturbance to the controller.

Unauthorized modifications of the originally delivered robot are prohibited. Without the consent of ABB it is forbidden to attach additional parts through welding, riveting, or drilling of new holes into the castings. The strength could be affected.

CAUTION

Ensure that a gripper is prevented from dropping a work piece, if such is used.

1.2.4.4 Safety risks related to pneumatic/hydraulic systems

General

Special safety regulations apply to pneumatic and hydraulic systems.

Note

All components that remain pressurized after separating the machine from the power supply must be provided with clearly visible drain facilities and a warning sign that indicates the need for pressure relief before adjustments or performing any maintenance on the robot system.

Residual energy

- Residual energy can be present in these systems. After shutdown, particular care must be taken.
- The pressure must be released in the complete pneumatic or hydraulic systems before starting to repair them.
- Work on hydraulic equipment may only be performed by persons with special knowledge and experience of hydraulics.
- All pipes, hoses, and connections have to be inspected regularly for leaks and damage. Damage must be repaired immediately.
- Splashed oil may cause injury or fire.

Safe design

- Gravity may cause any parts or objects held by these systems to drop.
- Dump valves should be used in case of emergency.
- Shot bolts should be used to prevent tools, etc., from falling due to gravity.

1 Safety

1.2.4.5 Safety risks during operational disturbances

General

- The industrial robot is a flexible tool that can be used in many different industrial applications.
- All work must be carried out professionally and in accordance with the applicable safety regulations.
- Care must be taken at all times.

Qualified personnel

Corrective maintenance must only be carried out by qualified personnel who are familiar with the entire installation as well as the special risks associated with its different parts.

Extraordinary risks

If the working process is interrupted, extra care must be taken due to risks other than those associated with regular operation. Such an interruption may have to be rectified manually.

1.2.4.6 Risks associated with live electric parts

Voltage related risks, general

Work on the electrical equipment of the robot must be performed by a qualified electrician in accordance with electrical regulations.

- Although troubleshooting may, on occasion, need to be carried out while the power supply is turned on, the robot must be turned off (by setting the main switch to OFF) when repairing faults, disconnecting electric leads and disconnecting or connecting units.
- The main supply to the robot must be connected in such a way that it can be turned off from outside the working space of the robot.
- Make sure that no one else can turn on the power to the controller and robot while you are working with the system. A good method is to always lock the main switch on the controller cabinet with a safety lock.

The necessary protection for the electrical equipment and robot system during construction, commissioning, and maintenance is guaranteed if the valid regulations are followed.

All work must be performed:

- by qualified personnel
- on machine/robot system in deadlock
- in an isolated state, disconnected from power supply, and protected against reconnection.

Voltage related risks, IRC5 controller

A danger of high voltage is associated with, for example, the following parts:

- Be aware of stored electrical energy (DC link, Ultracapacitor bank unit) in the controller.
- Units such as I/O modules, can be supplied with power from an external source.
- The main supply/main switch
- The transformers
- The power unit
- The control power supply (230 VAC)
- The rectifier unit (262/400-480 VAC and 400/700 VDC. Note: capacitors!)
- The drive unit (400/700 VDC)
- The drive system power supply (230 VAC)
- The service outlets (115/230 VAC)
- The customer power supply (230 VAC)
- The power supply unit for additional tools, or special power supply units for the machining process.
- The external voltage connected to the controller remains live even when the robot is disconnected from the mains.
- Additional connections.

Continues on next page

1 Safety

1.2.4.6 Risks associated with live electric parts

Continued

Voltage related risks, robot

A danger of high voltage is associated with the robot in:

- The power supply for the motors (up to 800 VDC).
 - The user connections for tools or other parts of the installation (max. 230 VAC).
-

Voltage related risks, tools, material handling devices, etc.

Tools, material handling devices, etc., may be live even if the robot system is in the OFF position. Power supply cables which are in motion during the working process may be damaged.

1.2.5 Safety actions

1.2.5.1 Safety fence dimensions

General

Install a safety cell around the robot to ensure safe robot installation and operation.

Dimensioning

The fence or enclosure must be dimensioned to withstand the force created if the load being handled by the robot is dropped or released at maximum speed.

Determine the maximum speed from the maximum velocities of the robot axes and from the position at which the robot is working in the work cell (see the section *Robot motion* in the *Product specification*).

Also consider the maximum possible impact caused by a breaking or malfunctioning rotating tool or other device fitted to the robot.

1 Safety

1.2.5.2 Fire extinguishing

Note

Use a CARBON DIOXIDE (CO₂) extinguisher in the event of a fire in the robot or controller!

1.2.5.3 Emergency release of the robot arm

Description

In an emergency situation, the brakes on a robot axis can be released manually by pushing a brake release button.

How to release the brakes is detailed in the section:

- [Moving the carriage manually on page 106.](#)

The robot arm may be moved manually on smaller robot models, but larger models may require using an overhead crane or similar equipment.

Increased injury

Before releasing the brakes, make sure that the weight of the arms does not increase the pressure on the trapped person, further increasing any injury!

DANGER

When releasing the holding brakes, the robot axes may move very quickly and sometimes in unexpected ways.

Make sure no personnel is near or beneath the robot arm.

1 Safety

1.2.5.4 Brake testing

1.2.5.4 Brake testing

When to test

During operation, the holding brake of each axis normally wears down. A test can be performed to determine whether the brake can still perform its function.

How to test

The function of the holding brake of each axis motor may be verified as described below:

- 1 Run each robot axis to a position where the combined weight of the robot arm and any load is maximized (maximum static load).
- 2 Switch the motor to the MOTORS OFF.
- 3 Inspect and verify that the axis maintains its position.

If the robot does not change position as the motors are switched off, then the brake function is adequate.

1.2.5.5 Risk of disabling function "Reduced speed 250 mm/s"

Note

Do not change *Transm gear ratio* or other kinematic system parameters from the FlexPendant or a PC. This will affect the safety function "Reduced speed 250 mm/s".

1 Safety

1.2.5.6 Safe use of the jogging device

1.2.5.6 Safe use of the jogging device

Three-position enabling device

The three-position enabling device is a manually operated, constant pressure push-button which, when continuously activated in one position only, allows potentially hazardous functions but does not initiate them. In any other position, hazardous functions are stopped safely.

The three-position enabling device is of a specific type where you must press the push-button only half-way to activate it. In the fully in and fully out positions, operating the robot is impossible.

Note

The three-position enabling device is a push-button located on the jogging device which, when pressed halfway in, switches the system to MOTORS ON. When the enabling device is released or pushed all the way in, the manipulator switches to the MOTORS OFF state.

To ensure safe use of the jogging device, the following must be implemented:

- The enabling device must never be rendered inoperational in any way.
- During programming and testing, the enabling device must be released as soon as there is no need for the robot to move.
- Anyone entering the working space of the robot must always bring the jogging device with him/her. This is to prevent anyone else from taking control of the robot without his/her knowledge.

Hold-to-run function

The hold-to-run function allows movement when a button connected to the function is actuated manually and immediately stops any movement when released. The hold-to-run function can only be used in manual mode.

How to operate the hold-to-run function for IRC5 is described in *Operating manual - IRC5 with FlexPendant*.

1.2.5.7 Work inside the working range of the robot

WARNING

If work must be carried out within the work area of the robot, then the following points must be observed:

- The operating mode selector on the controller must be in the manual mode position to render the three-position enabling device operational and to block operation from a computer link or remote control panel.
- The maximum speed of the robot is limited to 250 mm/s when the operating mode selector is in the position *Manual mode with reduced speed*. This should be the normal position when entering the working space.
The position *Manual mode with full speed (100%)* may only be used by trained personnel who are aware of the risks that this entails. *Manual mode with full speed (100%)* is not available in USA or Canada.
- Pay attention to the rotating axes of the robot. Keep away from axes to not get entangled with hair or clothing. Also, be aware of any danger that may be caused by rotating tools or other devices mounted on the robot or inside the cell.
- Test the motor brake on each axis, according to the section [Brake testing on page 32](#).
- To prevent anyone else from taking control of the robot, always put a safety lock on the cell door and bring the three-position enabling device with you when entering the working space.

WARNING

NEVER, under any circumstances, stay beneath any of the robot's axes! There is always a risk that the robot will move unexpectedly when robot axes are moved using the three-position enabling device or during other work inside the working range of the robot.

1 Safety

1.2.5.8 Signal lamp (optional)

1.2.5.8 Signal lamp (optional)

Description

A signal lamp with a yellow fixed light can be mounted on the robot, as a safety device.

Function

The lamp is active in MOTORS ON mode.

Further information

Further information about the MOTORS ON/MOTORS OFF mode may be found in the product manual for the controller.

1.3 Safety signals and symbols

1.3.1 Safety signals in the manual

Introduction to safety signals

This section specifies all dangers that can arise when doing the work described in the user manuals. Each danger consists of:

- A caption specifying the danger level (DANGER, WARNING, or CAUTION) and the type of danger.
- A brief description of what will happen if the operator/service personnel do not eliminate the danger.
- Instruction about how to eliminate danger to simplify doing the work.

Danger levels

The table below defines the captions specifying the danger levels used throughout this manual.

Symbol	Designation	Significance
 xx0200000022	DANGER	Warns that an accident <i>will</i> occur if the instructions are not followed, resulting in a serious or fatal injury and/or severe damage to the product. It applies to warnings that apply to danger with, for example, contact with high voltage electrical units, explosion or fire risk, risk of poisonous gases, risk of crushing, impact, fall from height, and so on.
 xx0100000002	WARNING	Warns that an accident <i>may</i> occur if the instructions are not followed that can lead to serious injury, possibly fatal, and/or great damage to the product. It applies to warnings that apply to danger with, for example, contact with high voltage electrical units, explosion or fire risk, risk of poisonous gases, risk of crushing, impact, fall from height, etc.
 xx0200000024	ELECTRICAL SHOCK	Warns for electrical hazards which could result in severe personal injury or death.
 xx0100000003	CAUTION	Warns that an accident <i>may</i> occur if the instructions are not followed that can result in injury and/or damage to the product. It also applies to warnings of risks that include burns, eye injury, skin injury, hearing damage, crushing or slipping, tripping, impact, fall from height, etc. Furthermore, it applies to warnings that include function requirements when fitting and removing equipment where there is a risk of damaging the product or causing a breakdown.
 xx0200000023	ELECTROSTATIC DISCHARGE (ESD)	Warns for electrostatic hazards which could result in severe damage to the product.

1 Safety

1.3.1 Safety signals in the manual

Continued

Symbol	Designation	Significance
 xx010000004	NOTE	Describes important facts and conditions.
 xx010000098	TIP	Describes where to find additional information or how to do an operation in an easier way.

1.3.2 Safety symbols on product labels

Introduction to labels

This section describes safety symbols used on labels (stickers) on the product.

Symbols are used in combinations on the labels, describing each specific warning. The descriptions in this section are generic, the labels can contain additional information such as values.

Note

The safety and health symbols on the labels on the product must be observed. Additional safety information given by the system builder or integrator must also be observed.

Types of labels

Both the robot and the controller are marked with several safety and information labels, containing important information about the product. The information is useful for all personnel handling the robot system, for example during installation, service, or operation.

The safety labels are language independent, they only use graphics. See [Symbols on safety labels on page 39](#).

The information labels can contain information in text (English, German, and French).

Symbols on safety labels

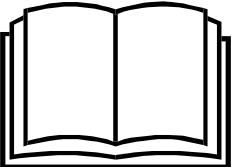

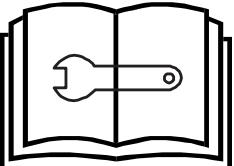

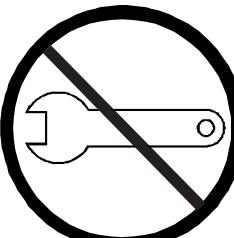

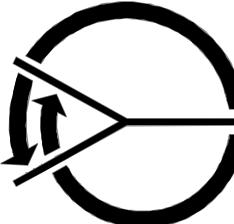

Symbol	Description
	Warning! Warns that an accident <i>may</i> occur if the instructions are not followed that can lead to serious injury, possibly fatal, and/or great damage to the product. It applies to warnings that apply to danger with, for example, contact with high voltage electrical units, explosion or fire risk, risk of poisonous gases, risk of crushing, impact, fall from height, etc. xx0900000812
	Caution! Warns that an accident may occur if the instructions are not followed that can result in injury and/or damage to the product. It also applies to warnings of risks that include burns, eye injury, skin injury, hearing damage, crushing or slipping, tripping, impact, fall from height, etc. Furthermore, it applies to warnings that include function requirements when fitting and removing equipment where there is a risk of damaging the product or causing a breakdown. xx0900000811
	Prohibition Used in combinations with other symbols. xx0900000839

 xx1400002648	Do not step Warns that stepping on these parts can cause damage to the parts.

1.4.1 DANGER - Moving robots are potentially lethal!

1.4 Safety related instructions

1.4.1 DANGER - Moving robots are potentially lethal!

Description

Any moving robot is a potentially lethal machine.

When running, the robot may perform unexpected and sometimes irrational movements. Moreover, all movements are performed with great force and may seriously injure any personnel and/or damage any piece of equipment located within the working range of the robot.

Elimination

	Action	Note
1	Before attempting to run the robot, make sure all emergency stop equipment is correctly installed and connected.	Emergency stop equipment such as gates, tread mats, light curtains, etc.
2	Usually the hold-to-run function is active only in manual full speed mode. To increase safety it is also possible to activate hold-to-run for manual reduced speed with a system parameter. The hold-to-run function is used in manual mode, not in automatic mode.	How to use the hold-to-run function is described in section <i>How to use the hold-to-run function</i> in the <i>Operating manual - IRC5 with FlexPendant</i> .
3	Make sure no personnel are present within the working range of the robot before pressing the start button.	

1 Safety

1.4.2 DANGER - First test run may cause injury or damage!

Description

Since performing a service activity often requires disassembly of the robot, there are several safety risks to take into consideration before the first test run.

Elimination

Follow the procedure below when performing the first test run after a service activity, such as repair, installation, or maintenance.

DANGER

Running the robot without fulfilling the following aspects, may cause severe damage to the robot.

	Action
1	Remove all service tools and foreign objects from the robot and its working area.
2	Verify that the robot is secured to its position, see installation section in the product manual for the robot.
3	Verify that any safety equipment installed to secure the robot arm position or restrict the robot arm motion during service activity is removed.
4	Verify that the fixture and work piece are well secured, if applicable.
5	Install all safety equipment properly.
6	Make sure all personnel are standing at a safe distance from the robot, that is out of its reach behind safety fences, and so on.
7	Pay special attention to the function of the part that previously was serviced.

Collision risks

CAUTION

When programming the movements of the robot, always identify potential collision risks before the first test run.

1.4.3 DANGER - Make sure that the main power has been switched off!**1.4.3 DANGER - Make sure that the main power has been switched off!****Description**

Working with high voltage is potentially lethal. Persons subjected to high voltage may suffer cardiac arrest, burn injuries, or other severe injuries. To avoid these dangers, do not proceed working before eliminating the danger as detailed below.

Elimination, IRC5 Single Cabinet Controller

	Action	Note/illustration
1		

1 Safety

1.4.4 WARNING - The unit is sensitive to ESD!

Description

ESD (electrostatic discharge) is the transfer of electrical static charge between two bodies at different potentials, either through direct contact or through an induced electrical field. When handling parts or their containers, personnel not grounded may potentially transfer high static charges. This discharge may destroy sensitive electronics.

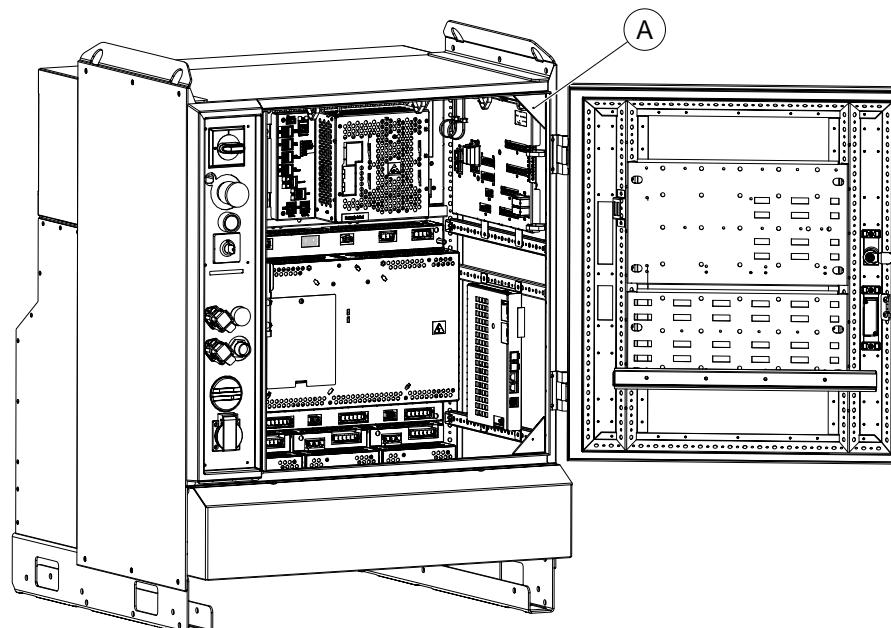

Elimination

Action	Note
1 Use a wrist strap.	Wrist straps must be tested frequently to ensure that they are not damaged and are operating correctly.
2 Use an ESD protective floor mat.	The mat must be grounded through a current-limiting resistor.
3 Use a dissipative table mat.	The mat should provide a controlled discharge of static voltages and must be grounded.

Location of wrist strap button

The location of the wrist strap button is shown in the following illustration.

IRC5

A Wrist strap button

1.4.5 WARNING - Safety risks during handling of batteries

Description

Under normal conditions of use, the electrode materials and liquid electrolyte in the batteries are not exposed to the outside, provided the battery integrity is maintained and seals remain intact.

There is a risk of exposure only in case of abuse (mechanical, thermal, electrical) which leads to the activation of safety valves and/or the rupture of the battery container. Electrolyte leakage, electrode materials reaction with moisture/water or battery vent/explosion/fire may follow, depending upon the circumstances.

Note

Appropriate disposal regulations must be observed.

Elimination

	Action	Note
1	Do not short circuit, recharge, puncture, incinerate, crush, immerse, force discharge or expose to temperatures above the declared operating temperature range of the product. Risk of fire or explosion.	Operating temperatures are listed in <i>Operating requirements on page 54</i> .
2	Use safety glasses when handling the batteries.	
3	In the event of leakage, wear gloves and chemical apron.	
4	In the event of fire, use self-contained breathing apparatus.	

1 Safety

1.4.6 WARNING - Safety risks during work with gearbox lubricants (oil or grease)

Description

When handling gearbox lubricants, there is a risk of both personal injury and product damage occurring. The following safety information must be regarded before performing any work with lubricants in the gearboxes.

Note

When handling oil, grease, or other chemical substances the safety information of the manufacturer must be observed.

Note

When aggressive media is handled, an appropriate skin protection must be provided. Gloves and goggles are recommended.

Note

Appropriate disposal regulations must be observed.

Note

Take special care when handling hot lubricants.

Warnings and elimination

Warning	Description	Elimination/Action
 xx0100000002 Hot oil or grease	Changing and draining gearbox oil or grease may require handling hot lubricant heated up to 90 °C.	Make sure that protective gear like goggles and gloves are always worn during this activity.
 xx0100000002 Allergic reaction	When working with gearbox lubricant there is a risk of an allergic reaction.	Make sure that protective gear like goggles and gloves are always worn.
 xx0100000002 Possible pressure build-up in gearbox	When opening the oil or grease plug, there may be pressure present in the gearbox, causing lubricant to spray from the opening.	Open the plug carefully and keep away from the opening. Do not overfill the gearbox when filling.

Continues on next page

1.4.6 WARNING - Safety risks during work with gearbox lubricants (oil or grease)

Continued

Warning	Description	Elimination/Action
 xx0100000002 Do not overfill	<p>Overfilling of gearbox lubricant can lead to internal over-pressure inside the gearbox which in turn may:</p> <ul style="list-style-type: none"> • damage seals and gaskets • completely press out seals and gaskets • prevent the robot from moving freely. 	<p>Make sure not to overfill the gearbox when filling it with oil or grease!</p> <p>After filling, verify that the level is correct.</p>
 xx0100000002 Do not mix types of oil	<p>Mixing types of oil may cause severe damage to the gearbox.</p>	<p>When filling gearbox oil, do not mix different types of oil unless specified in the instructions. Always use the type of oil specified by the manufacturer!</p>
 xx0100000098 Heat up the oil	<p>Warm oil drains quicker than cold oil.</p>	<p>When changing gearbox oil, first run the robot for a time to heat up the oil.</p>
 xx0100000004 Specified amount depends on drained volume	<p>The specified amount of oil or grease is based on the total volume of the gearbox. When changing the lubricant, the amount refilled may differ from the specified amount, depending on how much has previously been drained from the gearbox.</p>	<p>After filling, verify that the level is correct.</p>
 xx0100000003 Contaminated oil in gear boxes	<p>When draining the oil make sure that as much oil as possible is drained from the gearbox. The reason for this is to drain as much oil sludge and metal chips as possible from the gearbox. The magnetic oil plugs will take care of any remaining metal chips.</p>

2 Installation and commissioning

2.1 Before starting the track motion

Do this before starting the track motion

The following steps should be carried out before starting the track motion IRBT 2005.

Action	Reference
1 Unpack the track.	Compare the delivery checklist to the identification plates and verify for acceptance according to Acceptance inspection on page 56 and Lifting and moving track motion IRBT 2005 on page 61 .
2 Read through and follow the information and instructions for on-site installation of the track.	On-site installation on page 85
3 Align and level the track.	Correct the track motion according to Geometric alignment of track motion IRBT 2005 on page 103 .
4 Assemble the cable tray and manipulator (for robot track).	Assembling the manipulator and cable tray on page 115
5 Install the cable chain and connect all cables.	Electrical installation on page 125
6 Verify covers and cable chain.	Inspection of cables and covers prior to start-up on page 129
7 Connect voltage to the system.	Electrical installation on page 125
8 Start up the system.	Starting the system for the first time on page 130
9 Load software to the system.	Creating and downloading a system on page 131
10 Update the revolution counters.	Update revolution counters on page 265

2 Installation and commissioning

2.2 Operating requirements

2.2 Operating requirements

Protection standards

Standard Track Motion IP65 for mechanical parts and main electrical connections.

Explosive environments

The track motion cannot be located or operated in an explosive environment.

Ambient temperature

Description	Standard/Option	Temperature
Track motion during operation	Standard	+ 5°C ⁱ (41°F) to + 50°C (122°F)
For the controller	Standard/Option	See <i>Product specification - Controller IRC5 with FlexPendant</i>

- ⁱ At low environmental temperature < 10°C is, as with any other machine, a warm-up phase recommended to be run with the robot. Otherwise there is a risk that the robot stops or runs with lower performance due to temperature dependent oil- and grease viscosity.

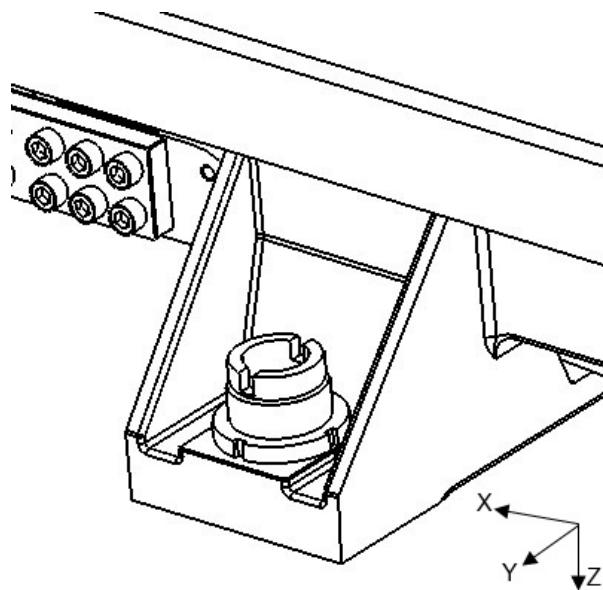

Relative humidity

Description	Relative humidity
Complete track during transportation and storage	Max. 95% at constant temperature
Complete track during operation	Max. 95% at constant temperature

2.3.2 Storage

Storing the cable chain

There are two methods for storing spare/not in use cable chains.

Method 1: folded in half

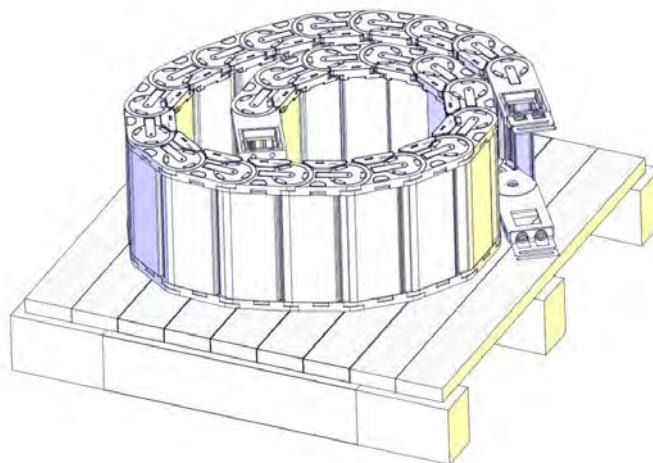

For complete chains with strapping in place and the strapping plates attached to the chains, the chain can only be folded in half. The chain can either be folded so that the chain is lying on itself or laid on its side.

xx1300000884

Method 2: rolled up

For complete chains with or without strapping in place or strapping in place and the strapping plate not connected to the chain, the chain can be rolled up and stored lying on its side.

xx1300000885

Continued

Moving the cable chain from storage

To move the chain from storage to track, see [*Lifting cable chain on page 67.*](#)

2.3.3 Unpacking

Inspection

The track motion IRBT 2005 has been pre-assembled in ABB factory. For delivery and storage's convenience, it would be divided into several segments as an unit depending on the length of the track when delivered.

The track IRBT 2005 is wrapped in plastic. Unpack the track and inspect for any visible transport damage. If the track motion is damaged, contact ABB.

Contents

As standard, the track motion IRBT 2005 includes the following on delivery:

- Track motion IRBT 2005 segments depending on the length

Cleaning

Before transport, the track motion IRBT 2005 has been protected against rust by a thin film of oil that has been applied before packing.

Note

Do not clean any of the pre-lubricated linear guide and rack.

	Action	Illustration/Note
1	Wipe off any surplus oil using a lint-free cloth.	

2 Installation and commissioning

2.3.4.1 Actions before lifting

2.3.4 Lifting the track motion

2.3.4.1 Actions before lifting

Removing cover plates

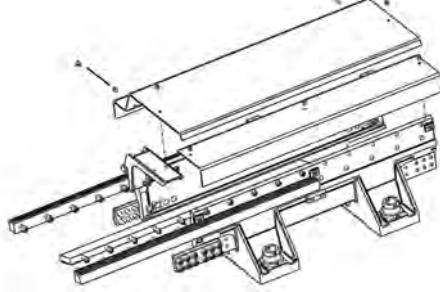

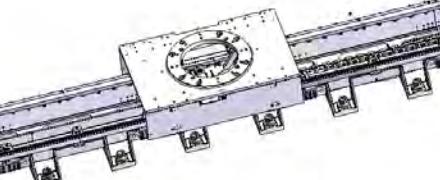

Before lifting the track motion, always remove the pre-mounted cover plates and rack plates.

WARNING

Never attempt to lift the track motion IRBT 2005 if the carriage is not in the centered position.

Preparations before lifting

Action	Illustration/Note
1 Remove the M6 socket head cap screws holding the cover plates and rack plates using standard tools.	 xx1500000127 A M6x12 Screw DIN6921, 9ADA181-11 (7pcs)
2 If the carriage is not in the centered position, move it by hand to the midpoint of the track.	 xx1500000129 For details, see <i>Moving the carriage manually</i> on page 106.

2.3.4.2 Lifting and moving track motion IRBT 2005

Actions before lifting

CAUTION

Read through the safety instructions carefully, before the track motion IRBT 2005 is unpacked and installed.

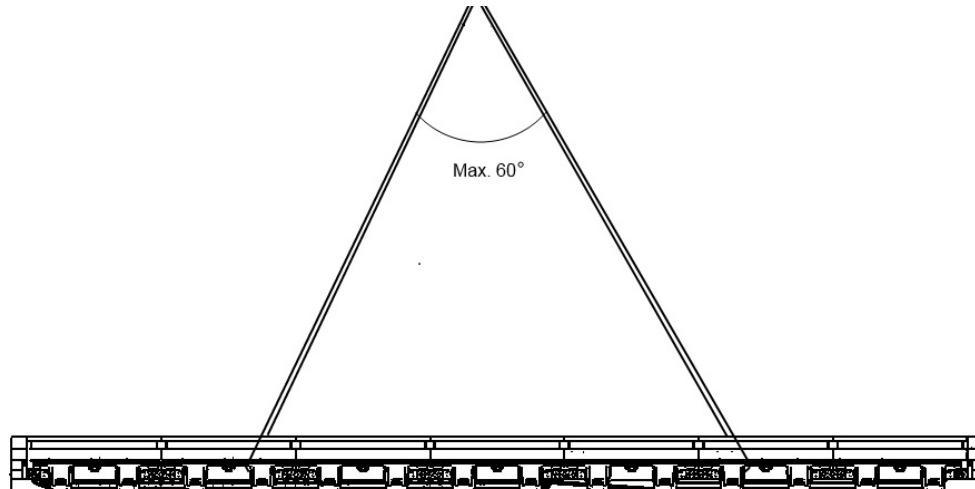

WARNING

Never lift the track IRBT 2005 in segments longer than 9 meters. If the track is longer, the track has to be disassembled into smaller segments.

Never lift the track IRBT 2005 using an overhead crane without first removing the cover plates.

Lifting zones

xx1400000234

WARNING

Never place lifting straps wider than a combined angel of max. 60°.

2 Installation and commissioning

2.3.4.4 Lifting cable chain

Continued

xx1400000522

Item	Description
A	Cable tray, 1 m
B	External chain raiser
C	External tray 1.45 m unit
D	External tray bracket unit

Plan the job

Cable chains are easily damaged through improper handling. Chains longer than 4 meters are heavy and cumbersome to move. In order to prevent personal injury and damage to the chain, make sure to pay attention while handling.

Read the procedure thoroughly before installing the chain and plan the job in advance, in regard to the actual installation site.

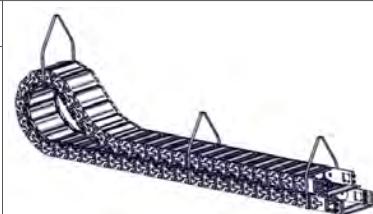

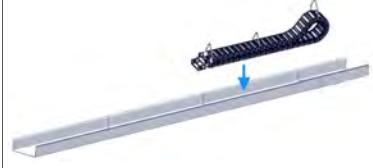

To move the chain from storage to track, use one of the methods described in this section. Method 2 requires an overhead crane.

Required equipment

Equipment	Art. No.	Note
Lifting slings, standard	-	Quantity depends on track length. Required if using lifting method 1.
Lifting sling, extra wide (50 mm)	-	Required if using lifting method 2.
Overhead crane	-	

Continues on next page

Method 1: lifting the cable chain that is folded in half

	Action	Illustration/Note
1	<p>! CAUTION</p> <p>Without cables, the internal cable chain weighs 3.4 kg / meter and the external cable chain weighs 8 kg / meter. All lifting accessories used must be sized accordingly!</p>	
2	Place the chain so that it is folded in half lying flat.	
3	<p>Place lifting slings on the two ends and in the middle.</p> <p>If the folded chain is longer than 4 meters then extra lifting slings should be placed so that the chain is supported every two meters.</p> <p>i Note</p> <p>This illustration for the procedure is for lifting external cable chain. Procedure for lifting internal cable chain is the same with this procedure.</p>	 xx1300000887
4	Lift the cable chain to the installation position above the cable tray. The chain should be placed so that both ends are in the middle of the track.	 xx1400001937
5	<p>There is no space for the lifting slings to stay fitted to the chain once it is lowered into the tray, therefore these must be removed before the cable chain is placed inside the tray.</p> <p>Lower the fixed and movable ends first, then continue lowering bit by bit until the complete chain is fitted into the tray, while at the same time removing the lifting slings one by one.</p>	

**CAUTION**

Make sure that the cable chain cannot come into contact with any moving parts.

Method 2: lifting the cable chain that is rolled

This procedure requires an overhead crane.

**CAUTION**

Without cables, the internal cable chain weights 3.4 kg / meter and the external cable chain weights 8 kg / meter. All lifting accessories used must be sized accordingly!

2 Installation and commissioning

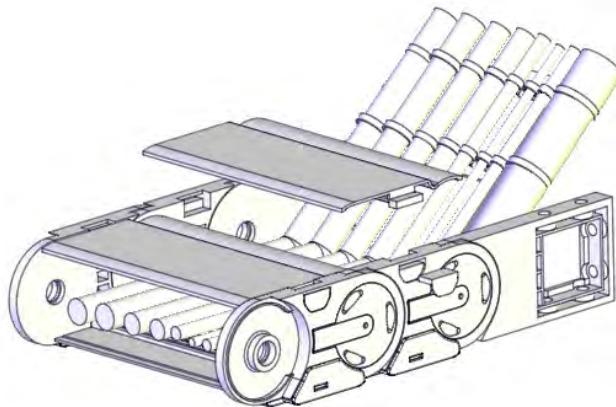

2.3.4.4 Lifting cable chain

Continued

Note

For external cable chain, in order to keep the correct length for long chains that are to be rolled, the strapping plate as well as the first cover and clips are removed. Refit these parts during installation.

xx1400001938

	Action	Illustration/Note
1	With the chain lying on its side, secure the loose end to ensure that the chain can not unroll during the lift.	 xx1300000888
2	Lift the chain so that it is standing upright and insert a wide lifting sling (50 mm) through the center of the chain.	 xx1300000889
3	Lift the cable chain to the installation position above the cable tray. The chain should be placed so that both ends are in the middle of the track.	
4	Lower the cable chain into the cable tray. The ends of the chain should be in the middle of the track.	

Continues on next page

CAUTION

Make sure that the cable chain cannot come into contact with any moving parts.

2 Installation and commissioning

2.3.5 Technical data for track motion

2.3.5 Technical data for track motion

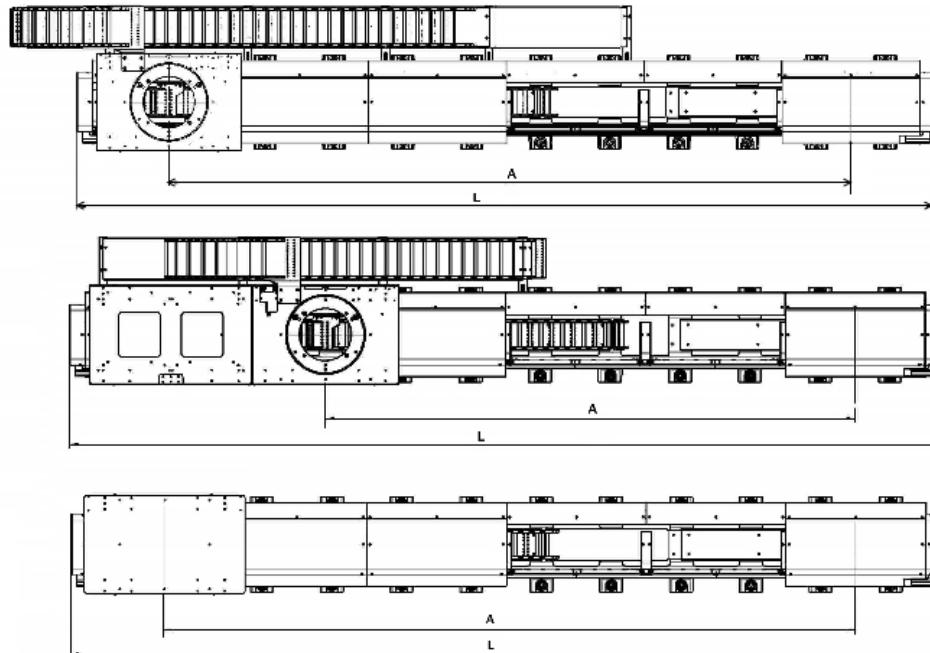

Travel length

The travel length of the IRBT 2005 track motion varies based on the carriage type and carriage quantity.

Carriage type	Carriage quantity	Description	Travel length (m) ⁱ
Robot track	Single carriage	Robot	0.8 to 19.8 (in steps of 1 m)
	Single carriage	Robot with extra plate	1.7 to 18.7 (in steps of 1 m)
	Double carriages	Robot + Robot	1.6 to 18.6 (in steps of 1 m)
	Double carriages	Robot + Robot with extra plate	1.4 to 17.4 (in steps of 1 m)
	Double carriages	Robot with extra plate + Robot with extra plate	1.3 to 16.3 (in steps of 1 m)
Transfer track	Single carriage/multiple carriages	Transfer	0.8 to 19.8 (in steps of 1 m) For every independent transfer track with a single carriage

ⁱ Travel length is the maximum distance that the carriage(s) can move.

Single carriage

xx1500001397

Item	Description
L	Total length of linear guide = $230 + 1000 \times N$ mm, in which N indicates the number of sections.

C2	Carriage 2 For transfer track, refer to Mounting of manipulator on the track on page 117 to acquire the mounting direction, standard or mirrored, of the carriage.
C3	Carriage 3 For transfer track, refer to Mounting of manipulator on the track on page 117 to acquire the mounting direction, standard or mirrored, of the carriage.

Required space for track installation

Note

The following tables only provide the space that the track motion itself requires. There is possibilities that additional spaces are required at the ends of the track motion at the installation site. In this case, add spaces as required.

Formula for required space

Required space for the track is calculated using the following formula:

Continues on next page

2 Installation and commissioning

2.3.5 Technical data for track motion

Continued

$$\text{Required space (mm)} = 230 + (1000 \times N)$$

In which, N indicates the number of sections.

Required space for installation of single carriage track - without external cable chain

The following table describes the required spaces for the installation of the tracks in different travel lengths without the external cable chain.

Travel length (m) ⁱ		Sections (pcs)	Required space for installation (m) ^{ii iii}
Robot/Transfer	Robot with extra plate	Value of N	
0.8	N/A	2	2.23

2.3.6 Measures of the carriage table

Robot carriage table

The robot carriage table is available to various robot models and the bolting patterns of the table match those of the robots. The robot carriage table is symmetrically designed to allow different manipulator mounting orientations (in line, 90 degrees, 180 degrees or 270 degrees) regardless of the table orientation.

Use the hole configuration for the manipulator when designing fixtures to be used on the track. The figures below show the dimensions of the robot carriage table in mm. Both tables on double carriage track are the same.

Eight M10 holes circled in the following figure are available for fastening the fixture on the carriage.

Extra plate

The figure below shows the dimensions of the extra plate in mm.

xx1400000462

Robot pedestal

The robot pedestal is designed to fix the robot.

The pedestal has two height models, 250 mm and 500 mm. Users can choose the suitable pedestal/pedestal combination to meet their requirements. The following height models can be provided by the pedestal/pedestal combination: 250 mm, 500 mm, 750 mm and 1000 mm.

Note

500mm, 750 mm and 1000 mm risers are not applicable to IRB 4600.

2.4 On-site installation

2.4.1 Foundation

Robustness

The foundation must withstand the static loads caused by the weight of the equipment and the dynamic loads generated by the movement of the carriage and the manipulator. The minimum thickness of the concrete floor is 175 mm.

The concrete quality class must be at least C20/25 (or B25) to insure a good resistance of the anchor. Class C30/37 (or B35) is advisable.

The concrete compressive strength can be tested according to the European norm EN 206-1.

Inclination and flatness

The leveling of the track is done by screwing / unscrewing the M60 screws.

However, in order to insure a good leveling, the foundation must be designed so that the track IRBT 2005 can be fitted without the incline exceeding 0.5 mm/m in the direction of travel and 0.2 mm/m across this. The leveling screws can also compensate a poor flatness of the slab and small bumps up to 10 mm. However, the surface under the leveling screw must be flat. A concrete surfacing grinder should be used to correct the flatness locally if necessary.

Maximum payload

The following table shows the maximum load that can be placed on the top plate of a carriage. At this maximum load, the following load would be distributed to each leveling screw.

Load	IRBT 2005
Max. load	The weight of IRBT 2005 payload + pedestal + 50 kg
Load on each leveling screw	Max. load/(2 x N), N is the number of sections

For weight of robots, see the product manual for the respective robot.

Maximum floor load

See the maximum floor loads in section [Forces on page 55](#).

2 Installation and commissioning

2.4.2 Mounting bolts

2.4.2 Mounting bolts

Mounting bolts

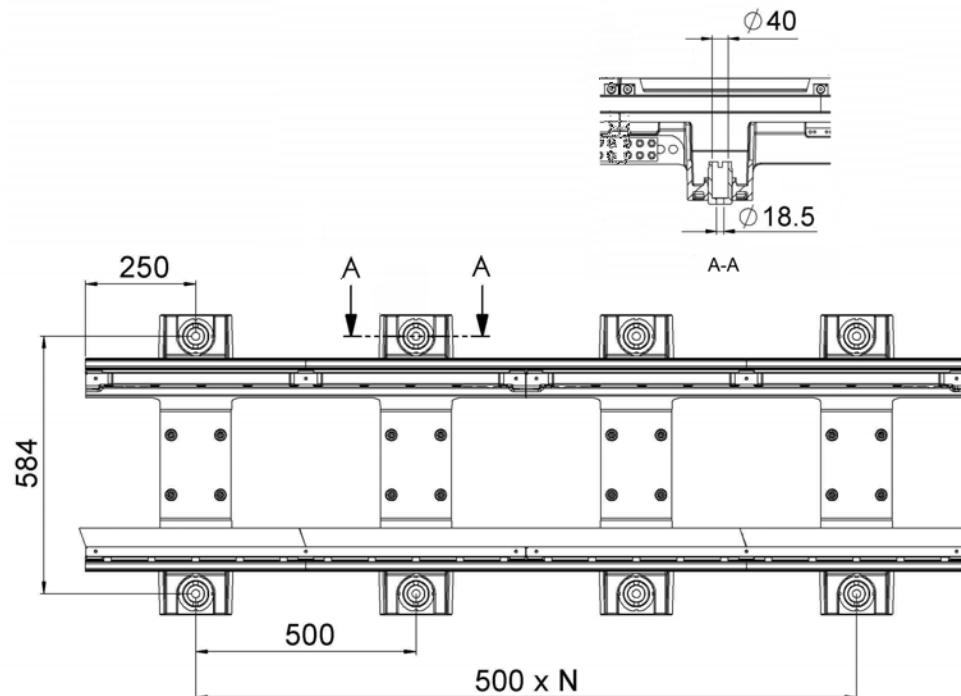

Chemical anchor bolts, bolting towards steel foundation, are recommended to secure the track motion IRBT 2005 to the floor. However, the mounting bolts are not supplied since they must be selected on the basis of the material the foundation is made of.

Choose mounting bolts so that they:

- Are suitable for the foundation.
- Can bear the dynamic loads.
- Are able to bear the combined dynamic loads that can occur when the manipulator and carriage move.
- Fit in the holes in the stand, Ø18.5 mm.

2.4.3 Hole configuration

Dimension

xx1400001434

The table describes the value of N in the figure above with different travel lengths.

Travel length	Total length of the stand	Quantity N
2.8 / 1.6 m	4 m	4
3.8 / 2.6 m	5 m	5
4.8 / 3.6 m	6 m	6
etc.

2.4.5 Assembling the sections of the track motion IRBT 2005 (Longer than 9 m)

Continued

Quantity	Description	Art. No.	Illustration
1	Calibration pin	3HAW107700354	

Procedures of assembly

The track motion is separated into 9 meter track segments when delivered. Tracks longer than 9 meters are divided and delivered in segments as described in [Weight of track motion and number of joined sections in transport on page 78](#) and [Required space for track installation on page 74](#). Use the following procedure to assemble the sections of the track motion IRBT 2005.

Positioning the sections

	Action	Illustration/Note
1	Mark up the required position of each IRBT 2005 section on floor.	 Note Make sure that the floor is clean before the assembly.
2	Position the pre-assembled track sections according to the markup.	
3	Level the 9-meter track sections with the M60 leveling screws as described in Geometric alignment of track motion IRBT 2005 on page 103 .

2 Installation and commissioning

2.4.5 Assembling the sections of the track motion IRBT 2005 (Longer than 9 m)

Continued

Action	Illustration/Note
9 Slightly tighten all the screws of the linear guides and finalize the horizontal alignment of the IRBT 2005 as described in Geometric alignment of track motion IRBT 2005 on page 103 .	

Inspecting clearance between linear guides

Action	Illustration/Note
1 Unscrew one block from the carriage and use it to verify the linear guide alignment: if the linear guides are correctly aligned, you should sense no "step" while passing the railways junction. If a step is felt, push the rail against the section and verify that there is no clearance between the rails.	
2 If clearance is found to be over 0.7 mm, adjust the fixing screws of the linear guides to limit the clearance into allowed scope.	<p>Note</p> <p>The installation holes of the linear guides are of the oval shape which allows the fine tuning of the linear guides in the x direction.</p>
3 Secure the square locking washers with screws.	<p>Note</p> <p>Start fixing lock washers from the rear end.</p>  <p>xx1400001751</p> <p>A M10x20 Hex socket countersunk screw DIN7991, 3HAC051482-001 B Square locking washer, 3HEA802935-001 C Upper right mark Tightening torque: 40 Nm</p>
4 When the alignment is correct, tighten the fixing screws of linear guides one by one.	Tightening torque: 40 Nm
5 If necessary, re-assemble the block in the carriage bracket. For how to disassemble and assemble ball bearing blocks, see Replacing the ball bearing blocks on page 184 .	Tightening torque: 10 Nm
6 Use a brush to lubricate the linear guides.	

Tightening the joint brackets

Action	Illustration/Note
1 Tighten the joint brackets with the fixing screws.	Tightening torque: 100 Nm

2.4.5 Assembling the sections of the track motion IRBT 2005 (Longer than 9 m)

Continued

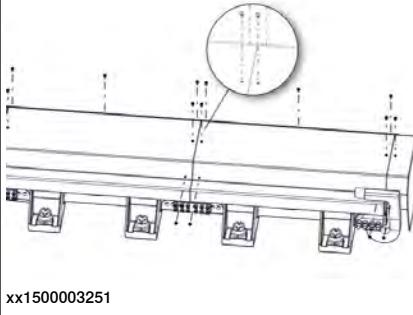

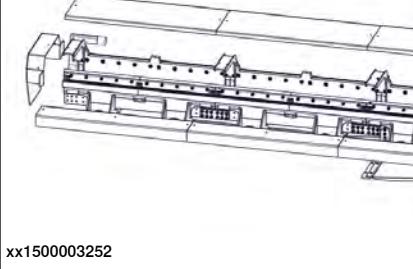

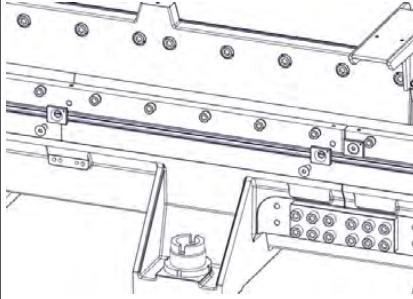

Removing sections if too long

Use this procedure to remove sections if the track is too long, until the required track length is achieved.

Tip

If sections need to be removed during the first-time assembly after delivery, it is OK to remove from any track segment. If sections need to be removed from an existed track, it is recommended to remove from the track end.

	Action	Illustration/Note
1	If required, press the brake release button to manually move the carriage sideways.	See Moving the carriage manually on page 106 .
2	Remove cover screws.	 xx1500003251
3	Remove the covers of the sections to be removed.  Note End covers need to be removed only when sections are to be removed from the track end.	 xx1500003252
4	Remove the square locking washers and screws, which clamp the linear guides at the junction.	 xx1500003253

2 Installation and commissioning

2.4.8 Moving the carriage manually

2.4.8 Moving the carriage manually

Releasing the brake

The carriage can be moved manually to another position on the track if necessary by connecting the power cable to the controller and releasing the brake.

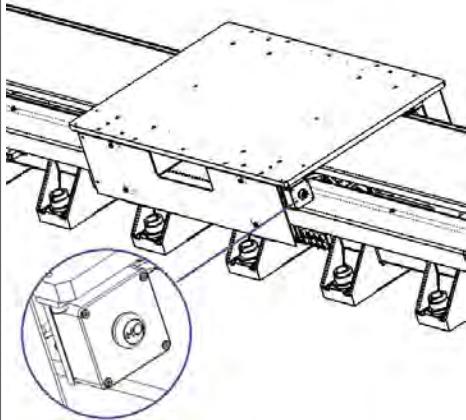

It is recommended that the carriage is manually moved along its complete stroke after being installed and before running the track using the IRC5. This is to ensure that there is no risk of collision other equipment in the vicinity of the track.

If there is no voltage to the motor, 24 VDC can be connected directly to the motor as described in [Releasing the brake with external 24 V DC on page 107](#).

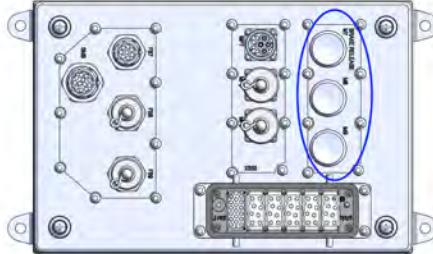

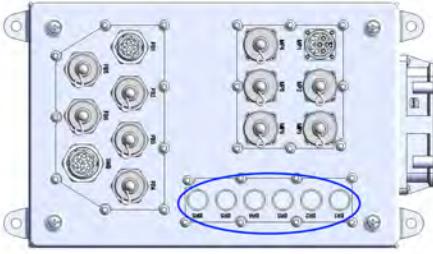

Note

If the carriage is moved manually, without connection to the IRC5 but by simply connecting directly 24 V DC to the motor to release the brake, a recalibration is needed.

Action	Illustration/Note
1 Connect all cables to the controller as described in The cabling from the controller on page 125 .	
2 Start up the controller as described in Connectors on controller, IRC5 on page 128 .	
3 Release the holding brake by pressing the brake release button on the carriage, which is shown in the figure, and keeping it depressed.	

Continues on next page

Action	Illustration/Note
4 For the transfer track with 3-axis or 6-axis SMB box, you can also: Release the holding brake on a particular axis by pressing the corresponding button on the 3-axis or 6-axis SMB box and keeping it depressed.	Brake release buttons on 3-axis SMB box:  xx1500000765 Brake release buttons on 6-axis SMB box:  xx1500000766 Note The 3-axis SMB box has three buttons for controlling the axes brakes, and the 6-axis SMB box has six buttons. The buttons are numbered according to the numbers of the axes.
5 Push the carriage to the desired location by hand.	
6 The brake will function again as soon as the button is released.	

Note

Care should be taken when moving the track manually. There is a risk of severe injury to hands near the calibration pin, as well as at the location where the rack and pinion mesh.

Users should remain clear of these locations when moving the track.

Releasing the brake with external 24 V DC

If there is no voltage to the motor, 24 V DC can be connected directly to the brake release.

Note

If the carriage is moved manually, without connection to the IRC5 but by simply connecting directly 24 V DC to the motor to release the brake, a recalibration is needed.

Continues on next page

2 Installation and commissioning

2.4.8 Moving the carriage manually

Continued

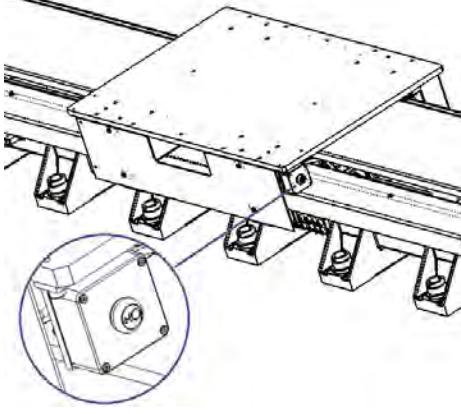

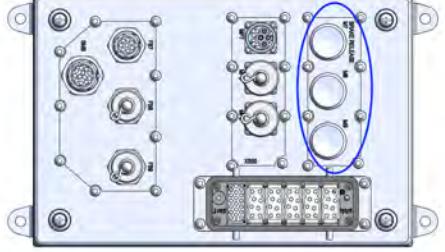

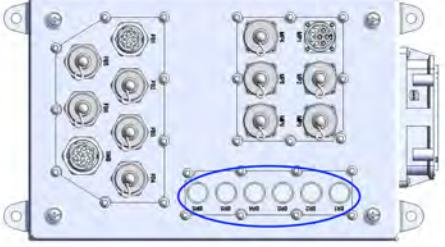

CAUTION

The motor brakes on the track motion IRBT 2005 are phase dependent. Incorrect polarity and unstable connection can cause damage to vital parts.

Action	Illustration/Note
1 For the robot track and transfer track with 3-axis SMB box: Disconnect the power cable connector XP7 from the controller.	For the location of the connector XP7, see Single Cabinet Controller on page 128 .
2 For the transfer track with 6-axis SMB box: Disconnect the power cable connector XP1 from the controller.	For the location of the connector XP1, see Single Cabinet Controller on page 128 .
3 Connect the external 24 V DC power supply to the power cable connector. <ul style="list-style-type: none">• Connect 24 V DC to pin f.8 (for connector XP7) or XP1.11 (for connector XP1)• Connect 0 V DC to pin f.9 (for connector XP7) or XP1.12 (for connector XP1) <p> Note</p> <p>Be careful not to interchange the 24 V and 0 V pins. If they are mixed up, damage can be caused to the brake release unit and the system board.</p> <p> WARNING</p> <p>Incorrect connections can cause all brakes to be released simultaneously.</p>	<p>Pin location on connector XP7 for the robot track:</p> <p>xx1500000762</p> <p>Pin location on connector XP7 for the transfer track with 3-axis SMB box:</p> <p>xx1500000763</p> <p>Pin location on connector XP1 for the transfer track with 6-axis SMB box:</p> <p>xx1500000764</p>

6 Push the carriage to the desired location by hand.	
7 The brake will function again as soon as the button is released.	

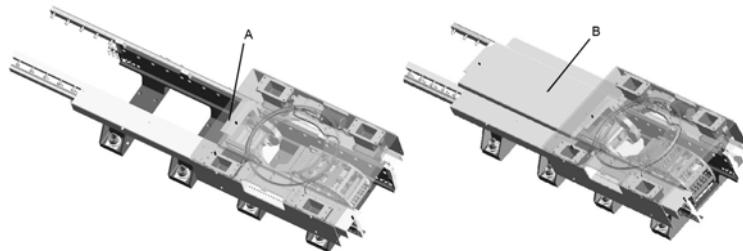

2 Installation and commissioning

2.4.9 Connecting long tracks

2.4.9 Connecting long tracks

Track extension

The track extension is an extension to an existing track. There are two types of track extension: covered track extension and standard track extension. Extensions are applied for the transfer track.

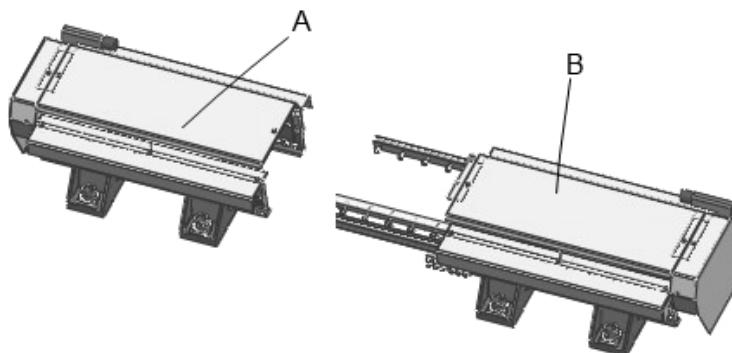

xx1400002677

A	Standard track extension
B	Covered track extension

Procedures of long track connection

Removing one end section of the track

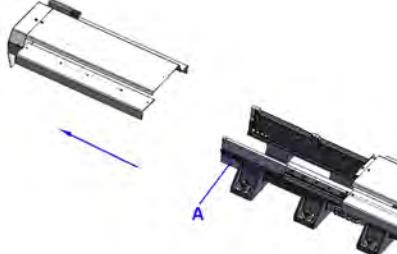

A track motion has two end sections (A and B in the following figure). Remove one of the end section as required.

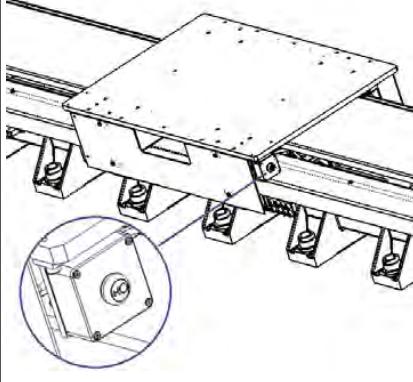

xx1400002676

	Action	Illustration>Note
1	Remove the top cover and rack cover of the end section.	

Continues on next page

Action	Illustration/Note
2 Remove the top cover support, joint bracket, and mechanical stop, and the last 0.5 m linear guides and racks on the end section. In this case, the extension section can be connected directly to the stand of the end section without removing the whole end section.	 xx1400002678 A Stand of end section

Connecting the extension section to existing track

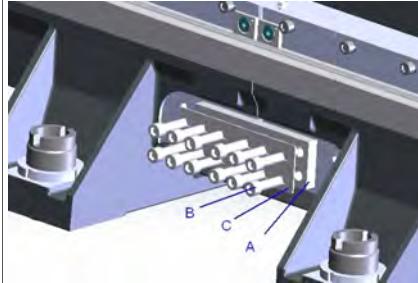

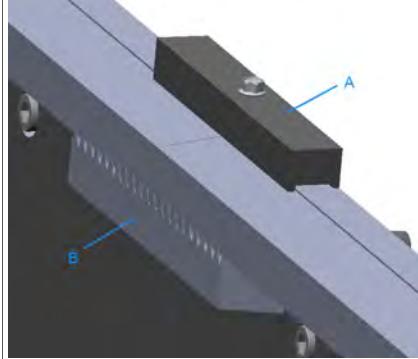

Action	Illustration/Note
1 Lift the extension section to desired location. Part of the section should be inserted between the rack and linear guide on the original track section.	Lifting is specified in <i>Lifting and moving track motion IRBT 2005 on page 61</i> .
2 Press the brake release button of extension section as shown in the figure.	 xx1400000465
3 Push the carriage by hand to show the rack and linear guide of extension section.	
4 Removed the cover on extension section if the section is covered track extension.	
5 Remove the bolts that are used as temporary stops on both sides of the extension section.  WARNING A track that is divided in sections has a bolt fastened to the end of the linear guides on both sides of the track in order to avoid the carriages from derailing during shipping. The bolts act as temporary stops and must be removed before assembling the sections.

2 Installation and commissioning

2.4.9 Connecting long tracks

Continued

Refitting the end section of the track

	Action	Illustration/Note
1	Refit top cover support, linear guides, joint brackets, mechanical stop, and the rack at the end side.  Note You should make sure the rack alignments are correct and the linear guides gap all less than 0.7 mm.	
2	Refit all the covers to be refitted.	

Securing the connected long track to the floor

- 1 After assembly, all the leveling screws should touch the floor. Adjust if necessary and tighten the locking nut. See [Positioning the stands on page 99](#).
- 2 Move the carriage all along the track way, and verify the leveling with a leveling device or a laser tracker. The levelness of the top plate must be satisfying in the translation direction, but also cross section. For how to adjust the leveling of the track, see [Geometric alignment of track motion IRBT 2005 on page 103](#). If you have moved the carriage manually, you probably need to initialize the resolver position, see [Update revolution counters on page 265](#).
- 3 Drill the holes in the floor through the leveling screws opening and install the anchors and secure the sections to the floor. See [Securing the sections on page 100](#).

2.5 Assembling the manipulator and cable tray

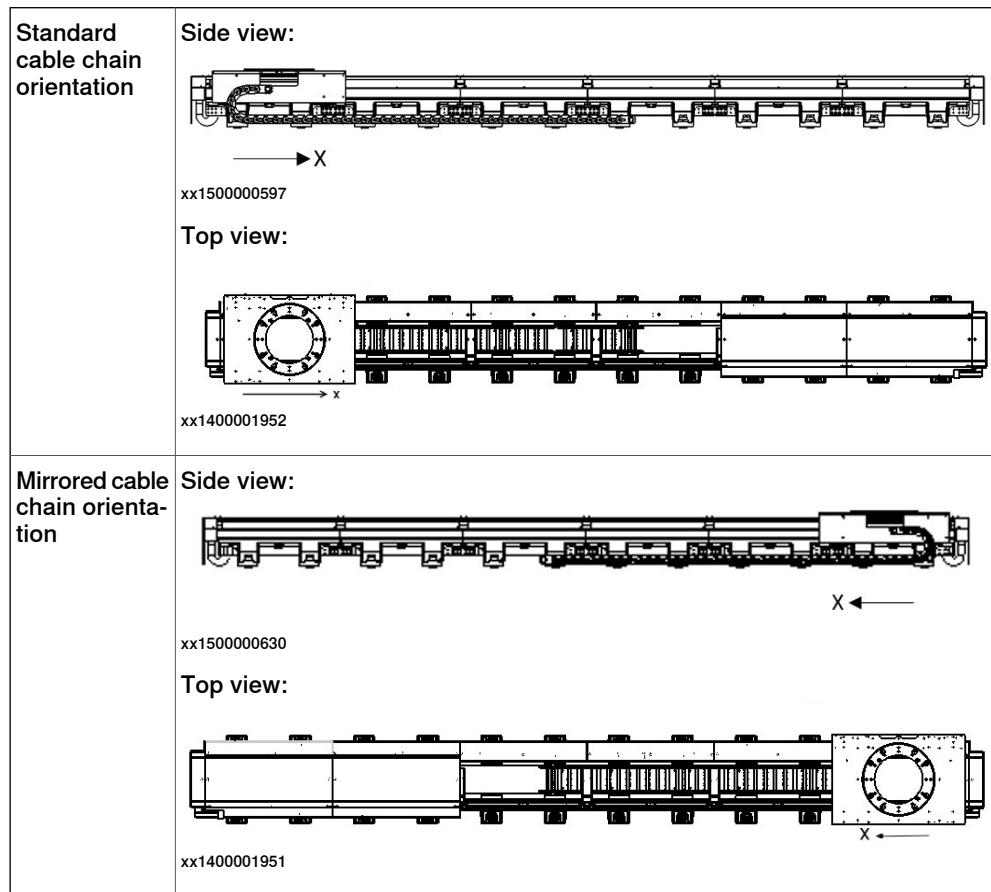

2.5.1 Assembling the manipulator

Overview

When IRBT 2005 is associated with an IRB robot, it behaves like an integrated 7th axis. However, the robot controller must fulfill some requirements to get an optimum integration. IRBT 2005 has been designed for ABB IRC5 controller. For how to link the robot to the track and how to orient the manipulator, see [Software installation on page 130](#).

Cable chain orientation

There are two orientations to fit the cable chain.

Robot capacity

The following table shows the robot capability of IRBT 2005.

Standard pedestals are generally allowed between the IRBT 2005 carriage and the robot but their height is limited and dependent on the type of the IRBT 2005 and the type of robot.

Continues on next page

2 Installation and commissioning

2.5.1 Assembling the manipulator

Continued

The following table defines what types of pedestals are applicable for the corresponding robot. x means that the pedestal is applicable.

Robot	250 mm pedestal	500 mm pedestal	750 mm pedestal	1000 mm pedestal
IRB 1520	x	x	x	x
IRB 1600	x	x	x	x
IRB 2600	x	x	x	x
IRB 4600	x	N/A	N/A	N/A

2.5.2 Mounting of manipulator on the track

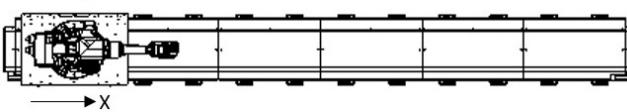

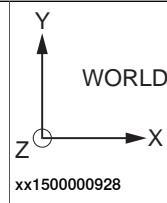

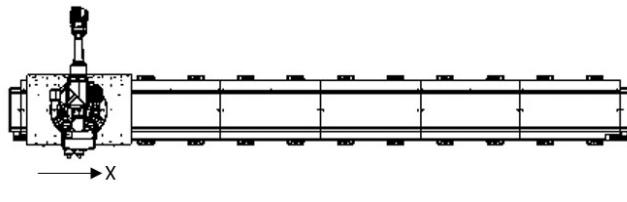

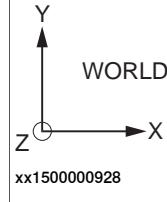

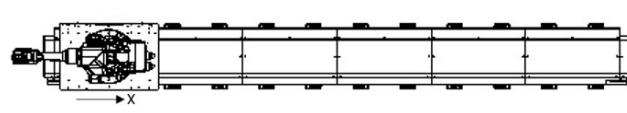

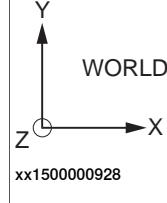

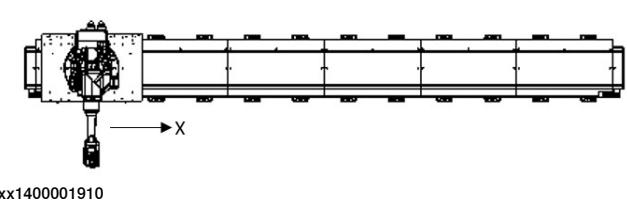

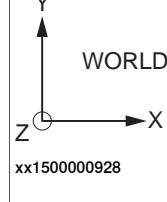

General

The manipulator can be mounted in four directions, 0 degrees (in line), 90 degrees, 180 degrees, and 270 degrees with the cable chain standard or mirrored. Other mounting orientations are not allowed. The world coordinate system is shown in the following figures.

Robot orientation with standard cable chain

Following figures illustrate the manipulator mounted in different directions with the standard cable chain.

The positive X direction is the positive motion direction of the track. The positive Y direction is the direction of the cabling outlet on the carriage.

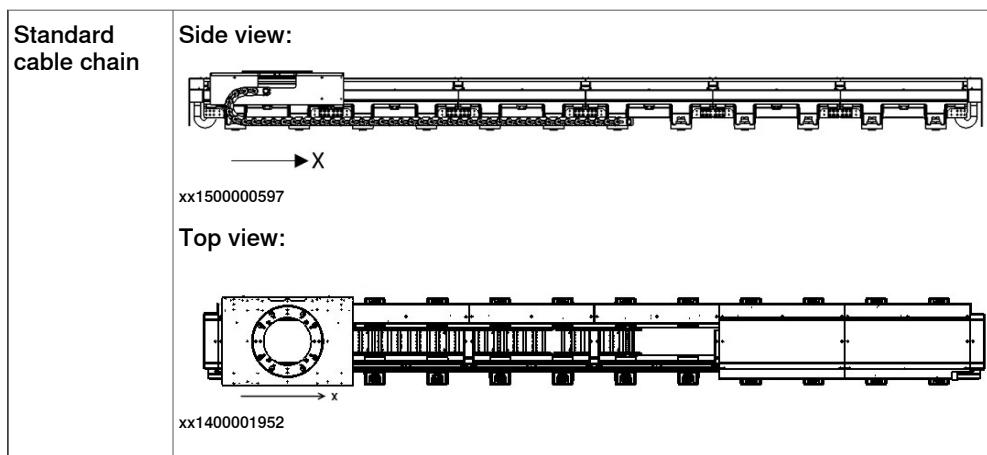

0 degrees (in line)	 xx1400001911	 xx1500000928
+90 degrees	 xx1400001912	 xx1500000928
+180 degrees	 xx1400001909	 xx1500000928
+270 degrees	 xx1400001910	 xx1500000928

4 Fit two guide bushings to the hole on the carriage table of the robot track according to the orientation of robot. For the guide bushing assembly positions, see Assembly position on page 119 .	
5 Guide the pedestal gently, using the screws while lowering it into its fitting position.	Make sure the pedestal is correctly fitted onto the guide bushings.
6 Refit the securing screws and plain washers in the attachment holes of the pedestal.	
7 Lift the robot back and gently put it onto the pedestal. Refit the securing screws and plain washers in the attachment holes of the robot base.	
8 Tighten the bolts in a criss-cross pattern to ensure that the base is not distorted.	

2.5.4 Assembling the cable tray

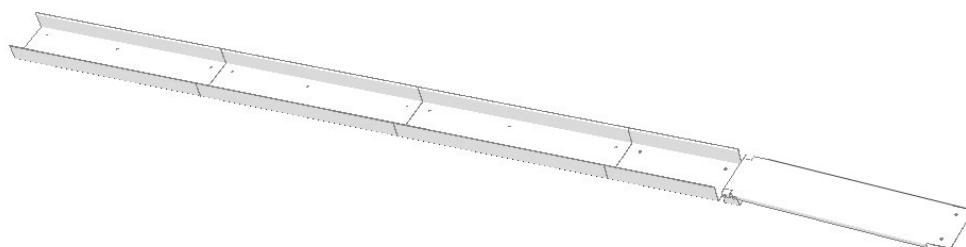

Overview

The cable tray made for the cable chain is made of sheet metals, fastened to the track machinings by screws directly or to brackets and thereby forming a tray.

xx1400001579

For track travel length shorter than 6 m, the cable tray is plain. While for track travel length equal to 5 m or larger than 5 m, a slope tray is needed to reduce the friction between the cable chain when the moving end of the cable chain moves passing the fixed end.

xx1400001580

Installing the cable tray

Installing the external cable tray

	Action	Illustration/Note
1	Fix the connection bracket for the external cable tray on the top plate of the carriage by screws.	A technical drawing showing a side view of a mechanical assembly. 2.6 Electrical installation

2.6.1 The cabling from the controller

Cable run

Cabling between the control equipment and the track motion should be run through cable conduits on the floor.

Connection points

For the robot track, connectors that connecting cable harness from the carriage (flexible cables) with cable harness from the controller (floor cables) are freely positioned on the ground.

For the transfer track, the SMB box is used as the connection between the cable harness from the track (flexible cables) and the cable harness from the controller (floor cables).

CAUTION

The floor cables must be grounded based on the requirements described in section [Circuit diagrams on page 285](#). Single-stranded copper wires with a diameter larger than 7 mm are recommended to be used as customer grounding cables, which will connect the cable grounding (Art. No.: 3HAC046927) of the track.

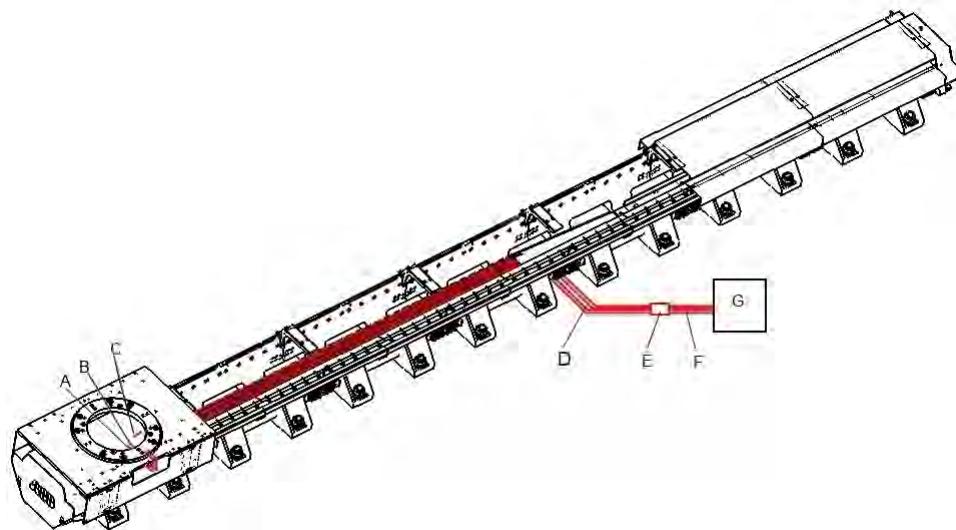

Continues on next page

2 Installation and commissioning

2.6.1 The cabling from the controller

Continued

The following illustration is based on the robot track.

ⁱ For the transfer track, this would be an SMB box.

2.6.2 Connections

2.6.2.1 Introduction

Connections

The wiring diagrams are described in section *Circuit diagrams on page 285*.

2 Installation and commissioning

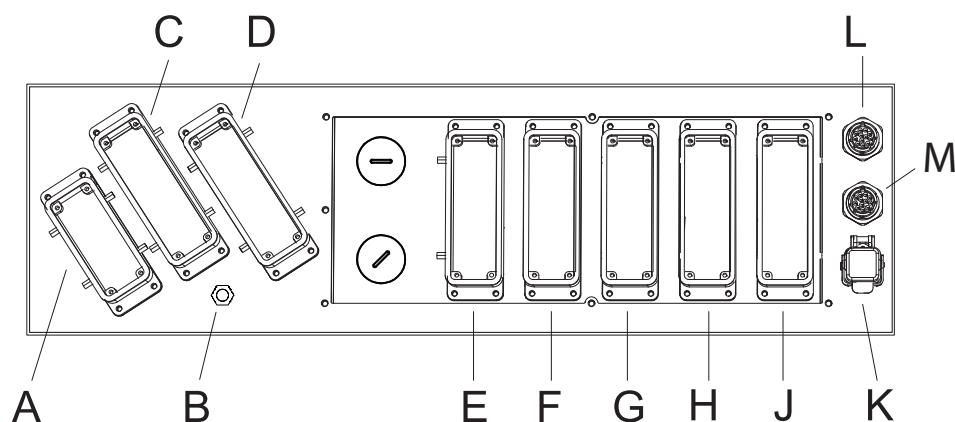

2.6.2.2 Connectors on controller, IRC5

General

The following section describes the connectors on the respective front panels of the IRC5 controller. These are described below, and detailed in section *Connectors on controller* in *Product manual - IRC5*.

Single Cabinet Controller

The following details the connection interface on the Single Cabinet Controller.

	Description
A	XP.0 Mains connection
B	Earth connection point
C	XS.1 Robot power connection
D	XS.7 Additional axes power connection
E	XS.13/XS.5 Customer power/signals external connection
F	XS.10 Customer options
G	XS.11 Customer options
H	XS.12 Customer options
J	X3 Customer safety signals
K	XS.28 Network connection
L	XS.41 Additional axes SMB connection
M	XS.2 Robot SMB connection

2.6.3 Inspection of cables and covers prior to start-up

2.6.3 Inspection of cables and covers prior to start-up**Procedures of inspecting cables and covers**

Use this procedure to inspect and adjust cables and covers before the track is commissioned.

	Action	Illustration>Note
1	Make sure there is no risk of collision between the cables and covers and the covers are well tightened.	
2	Make sure all cables are well secured and without risk for premature wear against plates or additional equipment. The cables exiting the chain, on both the moving and fixed end, need to be strapped individually at least twice in order to strain relief correctly. If there are not enough holes available in the connection plates for individual strapping, the cables should be secured in such a way that they can not move.	 xx1400001676 A Cable straps Suitable cable ties are specified in Required equipment on page 256 .
3	Make sure no floor cables are in risk of collision with moving parts.	

Guide channel inspection

Inspection	Yes	No
Guide channel free of foreign objects?		
Channel internal width > 2 mm and < 6 mm than chain outside width?		
Channel joints arranged flush and unobstructed?		
Guide channel running parallel to the moving end guide?		

2 Installation and commissioning

2.7.1 Starting the system for the first time

2.7 Software installation

2.7.1 Starting the system for the first time

General

Make sure that all steps of the physical installation is completed, see *Before starting the track motion on page 53*.

How to start the controller for the first time after the physical installation has been completed is described in *Operating manual - Getting started, IRC5 and RobotStudio*.

System status after startup

After startup, only the manipulator is configured in the controller. It will not be possible to jog or program using the track motion.

To activate the track motion, it is necessary to use RobotStudio to create a new system with the track motion settings and download the new system to the robot controller, see *Creating and downloading a system on page 131*.

2.7.2 Creating and downloading a system

Introduction

The PC application RobotStudio is used for creating and downloading systems to the controller.

The procedure how to create and download a system is different depending on if the controller is installed with RobotWare 5 or RobotWare 6. RobotStudio version 6 or later supports both procedures.

Note

The track motion IRBT 2005 is only supported by RobotWare 6 and later.

In RobotStudio, use Installation Manager to create and modify systems with RobotWare 6 and later.

For more information, see *Operating manual - RobotStudio*.

Before modifying the system

Before modifying the system it is recommended to take a backup of the system and put all axes of the robot and any external axes are in their zero positions.

Creating a system

In RobotWare 6, the track motion is loaded as an Add-In. The track motion Add-In does not require a license.

Use this procedure to create and modify the system.

	Action
1	Create a new system based on the existing system using the Installation Manager in RobotStudio.
2	In the Products tab, click Add and select the <i>RobotWare</i> and <i>TrackMotion</i> product manifests.
3	In the Licenses tab, add the license for RobotWare. The track motion does not require a license.
4	In the Options tab, Drive Modules pane, add the additional drive unit (ADU) that controls your track motion.
5	In the Options tab, Drive Modules pane, select and modify the options that suits your track motion. For example track motion type, robot orientation etc.
6	Complete the Installation Manager wizard.
7	Apply the changes to the system and restart the controller.
8	Load the necessary system parameters, system modules, and program modules from the backup and restart the controller.
	Note Do not restore the old motion configuration file <i>moc.cfg</i> , this will remove the track motion settings. Instead, use Load parameters and replace duplicates from the Configuration window on the FlexPendant Control Panel.
9	Update the revolution counters, see Update revolution counters on page 265 .

Continues on next page

2 Installation and commissioning

2.7.2 Creating and downloading a system

Continued

	Action
10	<p>Set the software limits for the track, see Setting upper and lower software limits for the track on page 133.</p> <p> Note</p> <p>Note that the default length of the track is set very short, for safety reasons, and has to be updated to the correct length.</p>
11	<p>Verify that the selected robot orientation on the track motion matches the physical configuration, see Base frame configuration on page 140.</p>

For more detailed instructions on using the Installation Manager, see *Operating manual - RobotStudio*.

2.7.3 Setting upper and lower software limits for the track

2.7.3 Setting upper and lower software limits for the track

Introduction

The upper and lower software limits of the track are software limits that prevent the track from being jogged beyond the mechanical limit of the track. They are the physical displacement distance from the zero position to the limit position in meters. This depends on the length of the track, and the location of the calibration pin (also referred to as the zero position of the track).

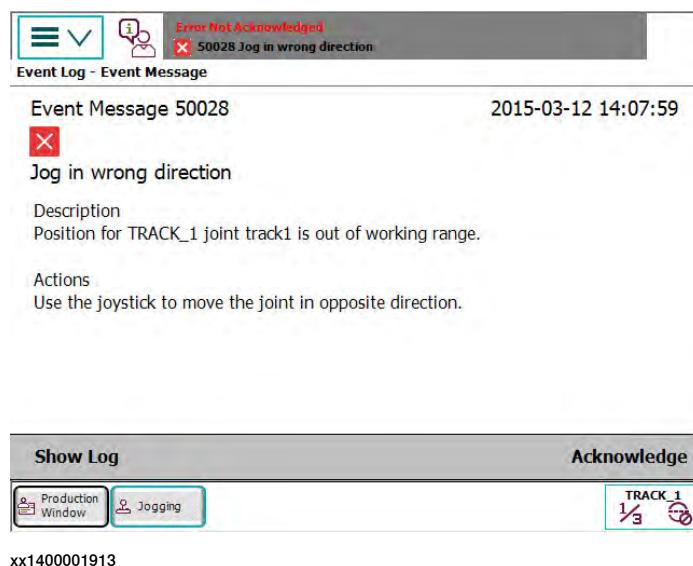

The limits are defined in the system parameters, in the topic *Motion*, type *Arm*. The upper limit is called *Upper Joint Bound*, and the lower limit is called *Lower Joint Bound*. Both are expressed in meters.

In the following example, the upper limit is set to 5.8 m and the lower limit is set to -0.5 m.

```
ARM : -upper_joint_bound 5.8 -lower_joint_bound -0.5
```

Example

The following screenshot shows an example of the error message that is generated when the track is jogged beyond its software limit.

Changing the limits

WARNING

This is an important safety feature to prevent damage to the track. Make sure that the track direction has first been set and the track has been calibrated before performing this step, see [Fine calibration on page 264](#).

Use this procedure to change the limits using the FlexPendant.

	Action	Note
1	From the ABB menu, tap Control Panel .	
2	Tap Configuration .	

Continues on next page

2 Installation and commissioning

2.7.3 Setting upper and lower software limits for the track

Continued

	Action	Note
3	Under Topics, tap Motion.	
4	Select Arm.	
5	Select the mechanical unit.	
6	Change the values for the parameters Upper joint bound and Lower Joint bound .	
7	Tap OK to save the change and then restart the controller.	

Examples of correct values for the software limits

The following tables show configuration values for *Upper Joint Bound* and *Lower Joint Bound* for a number of different configurations

Single robot carriage and signal transfer carriage

Identifying the upper and lower limits by experiment

If the actual value of the limit is not known, it is possible to jog the track to the desired limit position, and then read the limit value from the FlexPendant.

	Action	Note
1	Before beginning, make sure that the revolution counter for the IRBT 2005 is updated.	

Continues on next page

2 Installation and commissioning

2.7.3 Setting upper and lower software limits for the track

Continued

Action	Note
2 The upper and lower limit monitoring is active when in manual mode, thus it is first necessary increase the current limit to beyond the mechanical stop. This will then allow the track to be jogged without error up to the desired limit position. ARM : -upper_joint_bound 11 - lower_joint_bound -1	 WARNING If the actual track length is 10 meters in the positive direction of movement, and -0.060 meter in the negative direction, then first set the upper bound to 11 meters and the lower bound to -1 meters. xx1400001921
3 Restart the controller.	
4 Jog the mechanical unit to the desired limit position as shown in the figure.	 xx1400001923
5 In the jogging window, read the current position for the track motion.	
6 Update the limit value in the MOC file. (In this example it is 9950.1 mm.) ARM: -upper_joint_bound 9.950 - lower_joint_bound -1	 xx1400001922
7 Restart the controller.

2 Installation and commissioning

2.7.3 Setting upper and lower software limits for the track

Continued

Action	Note
<p>8 Set the jogging speed to 20% and test the software limit. If the software limit has been set correctly, the following error should be generated, see the figure.</p> <p> WARNING</p> <p>This step should be carried out with great care. If the software limit has not been set correctly the mechanical unit may hit the mechanical hard stop.</p>	
9 Repeat the previous steps for the other limit.	

2 Installation and commissioning

2.7.4.1 Introduction

2.7.4 Base frame configuration

2.7.4.1 Introduction

General

To ensure that the robot works properly in linear on its track motion, it is necessary that the orientation of the robot relative to the track is properly declared.

If the customer installation differs from the default selections available in Installation Manager it might be necessary to change the orientation of the robot relative to the track according to the examples below, see [Configuration examples on page 142](#).

Mounting directions

The manipulator can be mounted in four directions, in line, 90 degrees, 180 degrees and 270 degrees with the cable chain standard or mirrored, shown in the following figures. Other mounting orientations are not allowed.

For more information, see [Mounting of manipulator on the track on page 117](#).

System parameters

This is a brief description of the parameters used when configuring the base frame for robots on track motion. For more information, see the respective parameter in *Technical reference manual - System parameters*.

Robot

These parameters belongs to the type *Robot* in the topic *Motion*.

Parameter	Description
Base Frame x Base Frame y Base Frame z	<i>Base Frame x,y,z</i> defines the direction of the robot base frame position in relation to the world frame (in meters).
Base Frame q1 Base Frame q2 Base Frame q3 Base Frame q4	<i>Base Frame q1-q4</i> defines the quaternions of the robot base frame orientation in relation to the world frame.
Gamma Rotation	<i>Gamma Rotation</i> defines the orientation of the robot foot on the travel carriage.  Note The <i>Gamma Rotation</i> parameter is useful only for robots on track when the 7 axes high performance motion parameter is set. This parameter is not used for all robot types.

Single

These parameters belongs to the type *Single* in the topic *Motion*.

Parameter	Description
Base Frame x Base Frame y Base Frame z	<i>Base Frame x,y,z</i> defines the direction of the track motion base frame position in relation to the world frame (in meters).

Continues on next page

Parameter	Description
Base Frame q1	<i>Base Frame q1-q4</i> defines the quaternions of the track motion base frame orientation in relation to the world frame.
Base Frame q2	
Base Frame q3	
Base Frame q4	
Use Joint	<i>Use Joint</i> defines which joint data to use for the track motion.

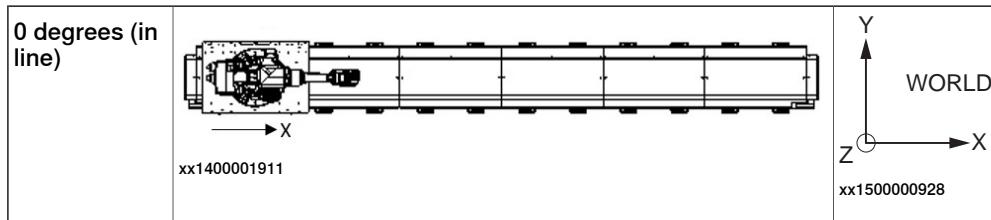

2 Installation and commissioning

2.8.1 Replacing the grease cartridge in grease pump MEMOLUB® EPS

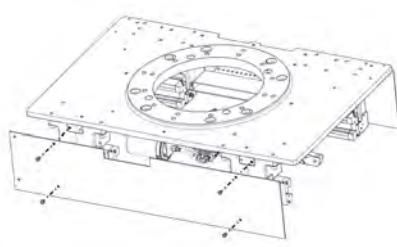

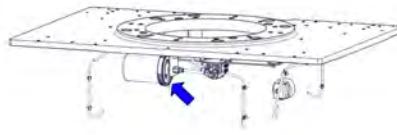

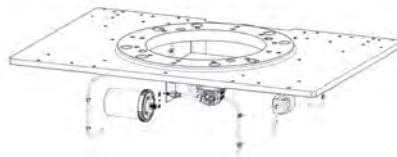

2.8 Lubrication

2.8.1 Replacing the grease cartridge in grease pump MEMOLUB® EPS

Overview

This section is based on the MEMOLUB® EPS user manual. It details how to replace the grease cartridge.

Removing the grease cartridge

	Action	Illustration/Note
1	Remove the carriage side covers.	 xx1500001620
2	Disconnect the cartridge power cable from the connector bracket on the carriage.	 xx1500000130
3	Screw the complete cartridge counterclockwise to remove it from its holder on the carriage.	 xx1500000131

Opening the grease pump

	Action	Illustration/Note
1	Place the grease pump on a flat and clean surface.	

Continues on next page

2 Installation and commissioning

2.8.1 Replacing the grease cartridge in grease pump MEMOLUB® EPS

Continued

Action	Illustration/Note
2 Push firmly with one hand on top of the grease pump. With the other hand, hold the black base and turn counterclockwise.	 xx1400001570
3 Pull the transparent housing and open it.	

Closing the grease pump

Action	Illustration/Note
1 Hold the cranked black base, put on the transparent housing and turn it clockwise.	 xx1400001571
2 When the closed position is reached you should hear a "click".	

Installing a new grease cartridge

Respect the following instructions to replace the grease cartridge:

Action	Illustration/Note
1 Open the MEMOLUB® as described before.	
2 Pull-up the black rubber seal. Fill-in the MEMOLUB® with a manual grease pump. This manual operation is required only if the MEMOLUB® has been used without a cartridge, if the previous cartridge has run out of grease. Place the pump nipple at the entry of the MEMOLUB®, and pump until you see grease coming out at the outlet. Two strokes of the manual pump are usually enough.	 xx1400001572

Continues on next page

2 Installation and commissioning

2.8.1 Replacing the grease cartridge in grease pump MEMOLUB® EPS

Continued

Action	Illustration/Note
3 Remove the paper disc from the replacement cartridge. Fill-in the required dates: "Started" and "Replace before". The "replace before" date is depending on the MEMOLUB® program. Put the paper disc back in place in order to see the instructions when the MEMOLUB® is closed.	 xx1400001574
4 Press softly on the cartridge until the grease comes out, to avoid injecting air into the pump.	 xx1400001575
5 Place the cartridge at the inlet of the pump. verify that the cartridge is correctly inserted in the inlet of the pump.	 xx1400001577
6 Place the spring and the compression disc inside the transparent bell. Put the bell back in place and verify that the compression disc is correctly lying on the top of the cartridge surface.	 xx1400001576
7 Close the MEMOLUB® as described before.	

Continues on next page

2.8.1 Replacing the grease cartridge in grease pump MEMOLUB® EPS

Continued

Test the grease pump MEMOLUB® (verify function)

CAUTION

It is important that you run this test cycle only if a cartridge is in place, otherwise you will fill the pump with air.

To verify that the grease pump is working well after a maintenance operation, press one of the 3 connectors located on the base during a few seconds. The grease pump is starting a dispensing cycle. The completion of the cycle means that the battery and the control board of the grease pump are working well.

xx1400001578

2 Installation and commissioning

2.8.2 Configuration of grease pump MEMOLUB®

2.8.2 Configuration of grease pump MEMOLUB®

Overview

This section is based on the MEMOLUB® installation instructions. It details how to configure the grease pump MEMOLUB®.

Configuration

The grease pump MEMOLUB® is set through combination of 3 plastic rings: black (Ø50 mm), white (Ø44 mm) and red (Ø38 mm).

The table shows the frequency of strokes and the duration of a 240 mm cartridge at different combinations.

50 mm  xx1600001020	44 mm  xx1600001021	38 mm  xx1600001022	Frequency hour(s)	Duration of a 240 mm cartridge month(s)
x			48	24
	x		24	12
x	x		16	8
		x	12	6
x		x	6	3
	x	x	2	1
x	x	x	1	1/2

Set of rings

The figure shows the 3 rings disassembled from the grease pump MEMOLUB®.

xx1600001023

2.9 Commissioning

2.9.1 Check list for IRBT 2005 before commissioning

Cables/hoses

Verify that...	Description
No stretch of the power and signal cables for the motor.	It is common to see these cables stretched, stood on, or with other cables resting on them.
Inspect the shielding	Stretched cables will inevitably affect the shielding and cause feedback issues and other damage.
No movement of the cable	If there is movement in the cables then they could get trapped and damaged.
Verify the length	If the length is excessive, it indicates that the orientation of robot is different to what was initially ordered. If cables have excessive length and are not strapped at all, cables could easily get caught and damaged in the dead stop.
Fixed position with straps.	If the cables are not fixed properly then they can easily get caught and damaged.
Is shielding visible?	Cables need to be tied to prevent this from happening. Spare ABB cable also needs to be tied out of the way.
Cables secured and not hanging loosely.	Robot cables need securing because they are loose down to the cable chain and could easily get damaged.

Cable chain

Verify that...	Description
Working correct in the entire length	Does the robot carrier run up and down the entire length of track without hitting the trunking, guarding etc?
No damage	Is there any damage to the cable chain such as step damage, twisted sections or brackets, etc?
Correct cable hoses length inside.	Ensure cables are not twisted, too tight or too loose inside cable chain.
Correctly secured with ties both ends and white marked.	Ensure that each cable is individually cable tied and identified using white marker to indicate movement.
Fixed position with straps.	If the cables are not fixed properly then they can easily get caught and damaged.
Each cable is individually tied and marked up correctly	-

Cable tray

Verify that...	Description
No wear against in or outside of the cable tray	Is there any wear on the inside or outside of the cable chain from being twisted and rubbing against cable tray?
Correctly tightened	Has the channel been secured correctly to the provided brackets?

Continues on next page

2 Installation and commissioning

2.9.1 Check list for IRBT 2005 before commissioning

Continued

Verify that...	Description
No step damage	Is there any step damage to any of the cable chain channel or support brackets, are they twisted causing cable chain to wear?
Verify fixing screws	Has the fixing screws been attached to the cable tray?

Lubrication system

Verify that...	Description
Sufficient quantity of grease in the can	When the low level light is on then the grease unit needs to be filled.
No leakage at the pump/under the track/ball bearing blocks	Ensure that each connection for the grease pipe work is not damaged or leaking grease.

Guiderail and ball bearing blocks

Verify that...	Description
Make sure that all ball bearing blocks and also the entire travel length of the guiderail receive grease in a proper quantity.	This can be verified by inspecting each individual bearing to ensure there is grease visible around them and by inspecting the guiderails also.
In case of suspected problem look after jumping marks at the end of each section.	When carrying out visual inspection it is also very important to feel along guiderails where the ball elements run to ensure that there are not any markings.

Track foundation

Verify that...	Description
Correct size bolts used	-
Track feet correctly packed to the floor	Stretched cables will inevitably affect the shielding and cause feedback issues and other damage.
Secured without movement	If there is movement in the cables then they could get trapped and damaged.

Gear rack

Verify that...	Description
The space and level between the gear racks is appropriate	-
All bolts are fitted	-
The torque on the bolts is appropriate	-

Guiderail

Verify that...	Description
Verify the space and the level between the guiderails	-
Verify that the locking washers have the mark up in the right corner	Must ensure correct as these washers determine the guiderails are mechanically level across the track sections.

Continues on next page

2 Installation and commissioning

2.9.1 Check list for IRBT 2005 before commissioning

Continued

Verify that...	Description
Verify the torque on the bolts	-

Connection bracket

Verify that...	Description
Verify that all brackets are in correct position	Brackets which connect track sections are dowelled and number identified to prevent incorrect fitting.
Verify that all bolts and the locking pins are fitted and have the right torque.	-

This page is intentionally left blank

3 Maintenance

3.1 Introduction

Structure of this chapter

This chapter describes all the maintenance activities recommended for the IRBT 2005.

It is based on the maintenance schedule found at the beginning of the chapter. The schedule contains information about required maintenance activities including intervals, and refers to procedures for the activities.

Each procedure contains all the information required to perform the activity, including required tools and materials.

The procedures are gathered in different sections and divided according to the maintenance activity.

Safety information

Observe all safety information before conducting any service work!

There are general safety aspects that must be read through, as well as more specific safety information that describes the danger and safety risks when performing the procedures. Read the chapter [Safety on page 15](#) before performing any service work!

Note

If the IRBT 2005 is connected to power, always make sure that the IRBT 2005 is connected to protective earth before starting any maintenance work!

For more information see:

- *Product manual - IRC5*

3 Maintenance

3.2.1 Specification of maintenance intervals

3.2 Maintenance schedule and expected component life

3.2.1 Specification of maintenance intervals

Introduction

The intervals are specified in different ways depending on the type of maintenance activity to be carried out and the working conditions of the IRBT 2005:

- Calendar time: specified in months regardless of whether the system is running or not.
- Operating time: specified in operating hours. More frequent running means more frequent maintenance activities.

3.2.2 Maintenance schedule

General

The track motion must be maintained regularly to ensure proper function. The maintenance activities and intervals are specified in the table below.

Non-predictable situations also give rise to inspections of the track. Any damages must be attended to immediately!

The inspection intervals *do not* specify the life of each component. Values for these are specified in the section [Expected component life on page 159](#)

Activities and intervals, standard equipment

The table below specifies the required maintenance activities and intervals.

Maintenance activity	Equipment	Interval
Cleaning	Linear guides	Every 100 km
Inspection	Cable chain	Every 3 months
Inspection	Linear guides	Every 3 months
Inspection	Felt gear	Every 3 months
Inspection	Cables and connectors at robot base, track motor and interchange to floor cable	Every 12 months
Inspection	Mechanical stops	Every 12 months
Inspection	Gear wheel, gearbox and backlash	Every 12 months
Inspection	Fitting bolts	Every 12 months
Adjustment of leveling	Complete track	Every 12 months
Replacement	Linear guide	When expected life is reached or if disturbances occur.
Replacement	Ball bearing blocks	When linear guides are replaced.
Replacement	Felt gear, gear wheel, gearbox and racks	When play can not be adjusted to specified ⁱ level.
Replacement	Glide shoes ⁱⁱ	When gliding surface thickness is 1.5 mm or less. ⁱⁱⁱ
Check the level	Automatic lubrication system	Every 1 month

ⁱ The play is specified in [Adjusting the gearbox backlash on page 231](#).

ⁱⁱ Glide shoes have been introduced to simplify and reduce the time associated with changing links.

ⁱⁱⁱ The first glide shoes to wear out will be located at the point where the chain first makes contact with itself during operation.

3 Maintenance

3.2.3 Gearbox oil

3.2.3 Gearbox oil

Where to find information about gearbox oil

Please see *Technical reference manual - Lubrication in gearboxes*
(3HAC042927-001) for information about gearbox oil.

3.2.4 Expected component life

General

The expected life of a specific component of the robot can vary greatly depending on how hard it is run.

Expected component life

Component	Expected life ⁱ	Note
Cables	2,000,000 cycles ⁱⁱ	See note ⁱⁱⁱ
Cable chain ^{iv}	Whichever occurs first: 2,000,000 cycles ^v or 18,000,000 gliding meters ^{vi} + addition 18,000,000 gliding meters if gliding shoes are changed .	
Gearbox	40,000 hours	
Ball bearing blocks	80,000,000 meters	

- ⁱ The expected life of all components is provided based on the typical cycle.
A typical cycle includes the robot IRB 2600 and track movement, starting from the initial position (A) and going to maximum extension (B), and back (A). The cycle is a 12-meter movement (from A to B to A, two 6-meter strokes) in 1 minute with the maximum acceleration 2.5 m/s² and maximum payload 1.2 tons. Deviations from this cycle will result in differences in expected life!
- ⁱⁱ The track is dimensioned for a life of 4 years (302,400 cycles per year) in a normal application
- ⁱⁱⁱ The expected life can also be affected by assemblage of cabling other than standard options.
- ^{iv} Due to process cycle variation and varying lengths of tracks the chains' lifetime is calculated on two parameters, gliding meters and bending cycles. When maximum limit of either parameter is reached the complete chain and or cables should be replaced.
In order to maximize the chains lifetime ensure to optimize the software and cell layout to reduce the amount of travel and cycles.
- ^v A cycle is comprised of two strokes / changes in direction.
- ^{vi} A gliding meter is described as the chain making contact with itself or the glide bars. Chains on tracks shorter than 6 meters travel distance do not have gliding contact.

3 Maintenance

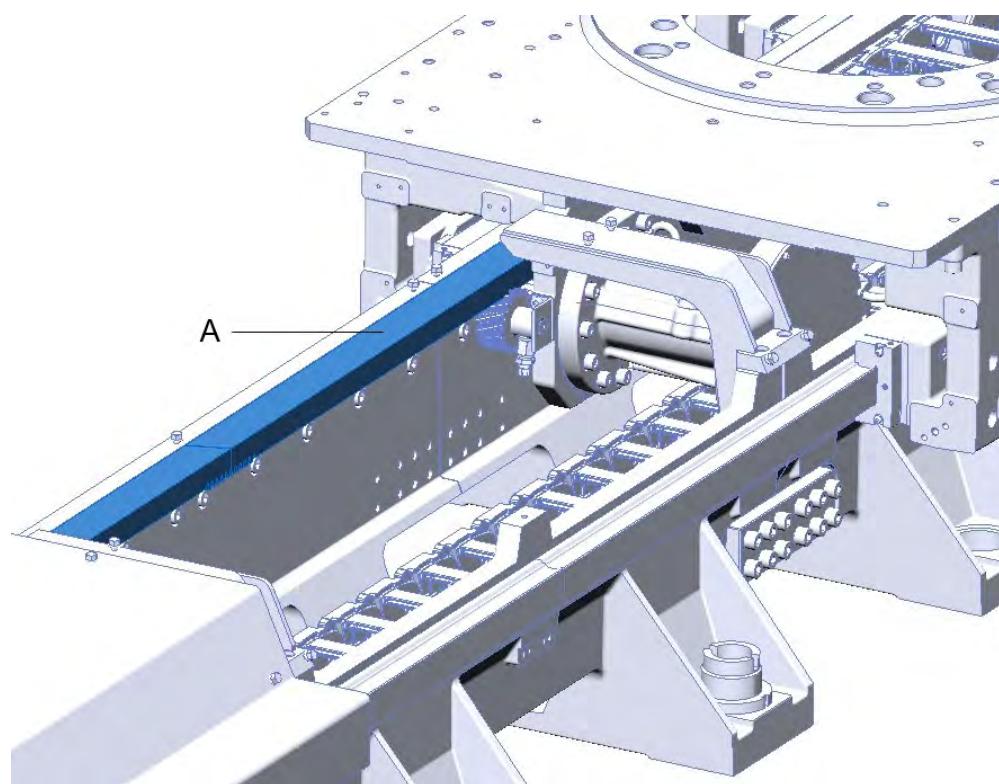

3.3.1 Cleaning the rack

3.3 Activities 100 km or 1 week

3.3.1 Cleaning the rack

Location

The racks are located as shown in figure.

xx1400000461

A	Rack
---	------

Required equipment

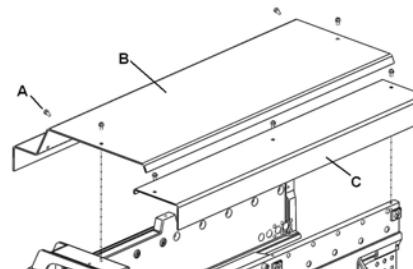

When you clean the racks, it is necessary to lubricate the racks manually. Use one of the recommended lubricants:

Equipment	Note
Lubricant	KLÜBER Microlube GB0
Lubricant	TOTAL Multis EP 0
Lint free cloth	

Continues on next page

Lubricating the racks

Use this procedure to lubricate the racks and pinion:

	Action	Illustration/Note
1	Remove IRBT 2005 upper covers and rack covers.	 xx1400000231 A Screw DIN6921 M6x12 B Top cover of the track C Rack cover of the track
2	Inspect the racks and the pinion, clean them if necessary.	 Note Use lint free cloth.
3	Use a brush to lubricate the racks.	
4	Refit the covers.	

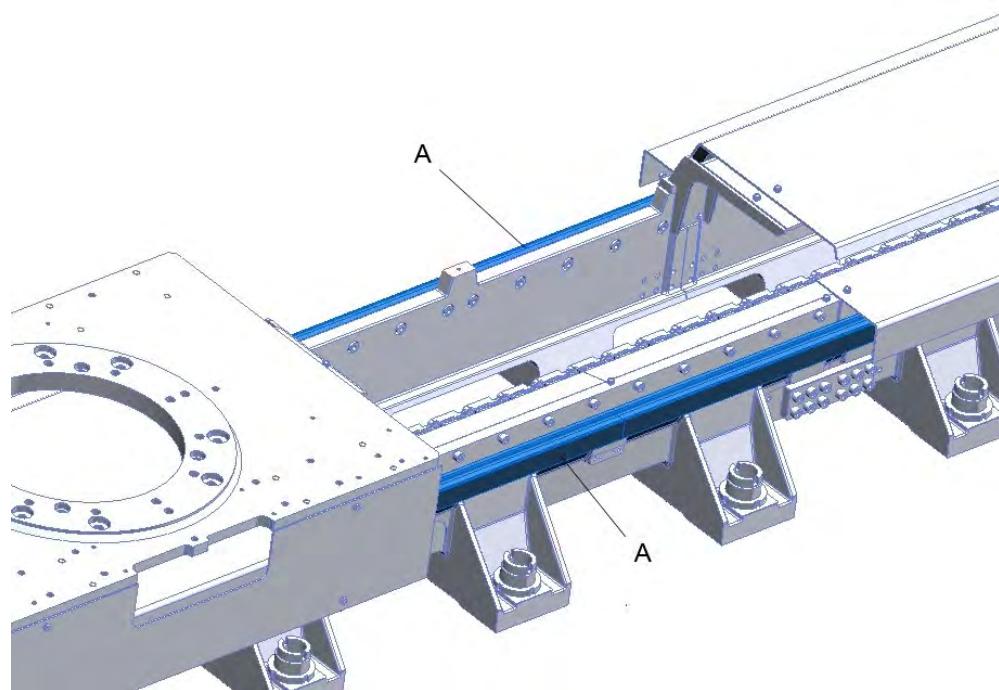

3 Maintenance

3.3.2 Cleaning the linear guides

3.3.2 Cleaning the linear guides

Location of linear guides

The linear guides are located as shown in figure.

xx1400000466

A	linear guides
---	---------------

Required equipment

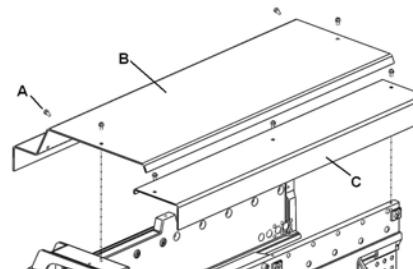

When you clean the linear guides, it is necessary to lubricate them manually. Use one of the recommended lubricants:

Equipment	Note
Lubricant	KLÜBER Microlube GB0

Cleaning the linear guides

Use this procedure to clean and, if necessary, lubrication of the linear guides.

	Action	Illustration/Note
1	Remove IRBT 2005 upper covers and rack covers.	 <p>xx1400000231</p> <p>A Screw DIN6921 M6x12 B Top cover of the track C Rack cover of the track</p>
2	Inspect the linear guides, clean them if necessary.	 <p>Note Use lint free cloth.</p>
3	If you have cleaned them, use a brush to lubricate the linear guides.	
4	Move the carriage back and forth and repeat step 3.	
5	Refit the covers.	

3 Maintenance

3.4.1 Inspecting the automatic lubrication system

3.4 Activities 1 month

3.4.1 Inspecting the automatic lubrication system

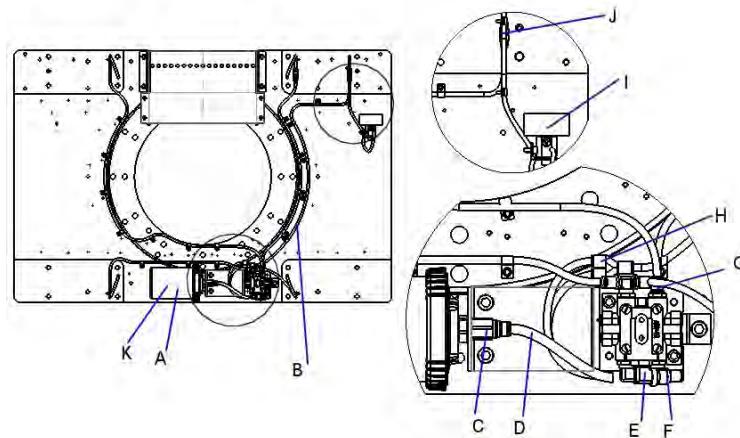

Overview

There is an automatic lubrication system in IRBT 2005. An electric pump will deliver the correct quantity of grease from a cartridge to the ball bearing blocks and to the pinion at required time intervals (one cycle per day). The grease is pushed in the piping by the pump; a valve is sequencing the distribution to each port.

The level of the lubricant should be inspected once a month, even though the system should apply the lubricant equally over a longer period.

Location of lubrication system

The lubrication system is located as shown in the figure.

xx1400000478

Pos	Description
A	Lubrication pump EPS 240
B	Polyamide tube 4x6
C	Straight adaptor F1/4-D8
D	Polyamide tube 6x8

Required equipment**Required tool**

Equipment	Art. No.	Note
Standard toolkit	-	Content is defined in section Standard tools on page 276 .
Other tools and procedures may be required. See references to these procedures in the step-by-step instructions below.		These procedures include references to the tools required.

Required lubricant

 **WARNING**

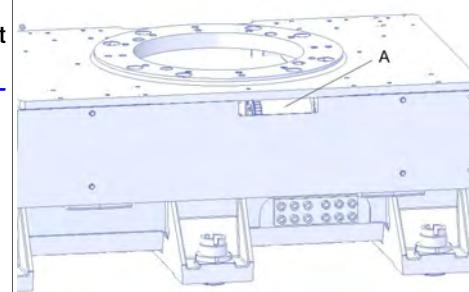

Use lithium soap flowable grease, class NLGI 0, with a mineral oil base, doped with EP (extreme pressure) additives. The base oil viscosity must be ISO VG68 to ISO VG 100.

Grease doped with EP additives is absolutely necessary, due to high loads on blocks.

Equipment	Note
Lubricant	KLÜBER Microlube GB0
Lubricant	TOTAL Multis EP 0

Inspecting the grease level and inspecting the pipes

Use this procedure to inspect the grease level and inspect the pipes of the lubrication system.

	Action	Illustration/Note
1	Locate the cartridge.	
2	Check the level of lubricant, if necessary replace the cartridge. For information about cartridge replacement, see Replacing the grease cartridge in grease pump MEMOLUB® EPS on page 146 .	 <p>A Checking lubrication cup level through the notch</p>

Continues on next page

3 Maintenance

3.4.1 Inspecting the automatic lubrication system

Continued

Action	Illustration/Note
3 Check that no pipe has been damaged, and that the grease is arriving to each block and at the pinion lube tube.	 xx1400001585

Checking the performance

The automatic lubrication system should be checked that it can work properly. For information about checking Memolub function, see [Test the grease pump MEMOLUB® \(verify function\) on page 149](#).

3.4.2 Emergency stop and stroke limit system

General

It is recommended to ensure the emergency stop and stroke limit system effectiveness every month.

Motor brake

The procedure below details how to ensure the effectiveness of the motor brake in case of emergency stop.

	Action	Illustration>Note
1	Ensure that the IRBT 2005 is powered, but not moving.	
2	Press the emergency stop button.	
3	The brake is applied; you should hear the noise in the motor area.	
4	Try to push the carriage manually.	
5	If the brake is correctly applied, it is not possible to move the carriage manually.	
6	Proceed with the required validations in the control system to switch back to auto mode.	

Verification of the effectiveness of the stroke limit system

A software limit prevents the carriage from moving beyond its acceptable upper and lower stroke limits.

The procedure below details how to ensure the software stroke limit is working correctly:

	Action	Illustration>Note
1	Switch the IRC5 to manual mode.	
2	With the teach pendant, try to jog the carriage to both ends.	
3	If the software limits are functional, it should not be possible to go beyond the defined upper or lower end position, and it should not be possible to reach the hard stops.	

3 Maintenance

3.4.3 Inspecting the cables and connectors

WARNING

Turn off all electric power and pneumatic pressure supplies to the robot and for IRBT 2005.

Inspecting the cables

Use this procedure to check the cables.

Action	Illustration/Note
1 Check if any cables have been damaged through wear or pinching. If damaged then replace the cable.	
2 Check if any cables rub against sharp edges. If so, route the cable so that it runs freely.	Replace the cable, remove the cause of the wear, or route the cable in a different way.
3 Check strain relief of cables and hoses. Marking should be close to the corresponding strap. If not, pull the hose/cable to the correct position and strap it.	

Inspecting the connectors

Check that the connectors at the robot base, track motor and interchange to the floor cable are firmly secured and that there is no damage of cable outlet.

Inspecting the cable chain

Once a month check that the cable track shows no trace of excessive wear due to rub on a fixed part. If one element is damaged, it is possible to replace it without removing the whole chain from IRBT 2005.

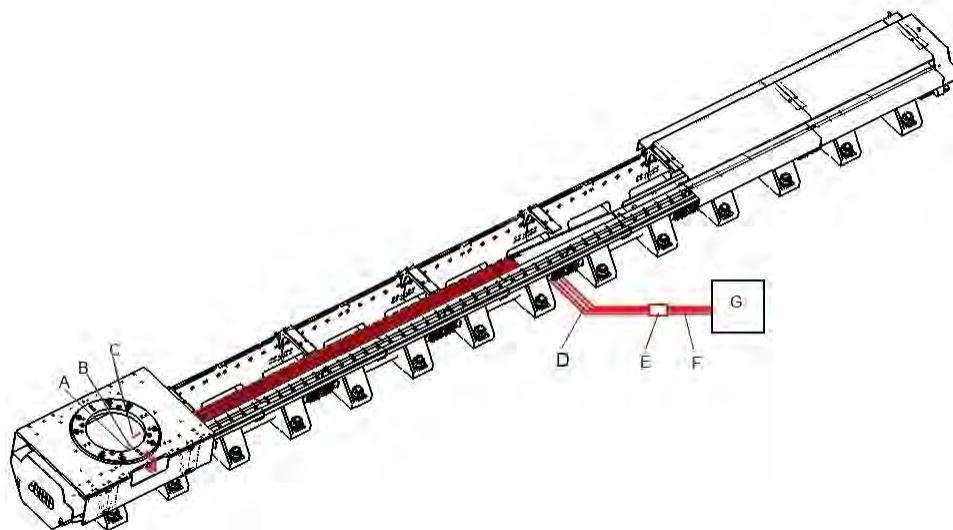

3.5.1 Inspecting the cable chain

3.5 Activities 3 months

3.5.1 Inspecting the cable chain

Location of harness

The track cable harness is totally located in the cable chain.

xx1400001286

A	Customer cables
B	Track motor and manipulator power cables
C	Signal cables for the manipulator and IRBT 2005 track motor
D	Cable chain
E	Cable connectors or SMB box connecting cables from the track and from IRC5 controller
F	Floor cables from the controller
G	IRC5 controller

Required equipment

Equipment	Art. No.	Note
Visual inspection	-	
Cable ties	21662055-3	Needed if the cable strapping needs to be improved. Use heavy duty cable ties with minimum width: 4.9 mm.
Locking liquid	-	Loctite 243 Used if loose screws are detected.

Continues on next page

3 Maintenance

3.5.1 Inspecting the cable chain

Continued

Checking the emergency stop

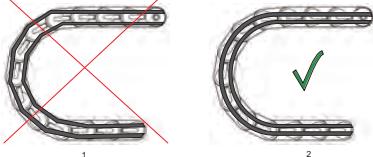

Action	Illustration/Note
1 Allow the track motion to stop.	
2 Press the emergency stop button.	
3 Try to start the track.	

Inspecting the connection plates

Action	Illustration/Note
1 Check and rectify the cables are tied on the connection plates tightly and neatly.	

Inspecting the cable chain

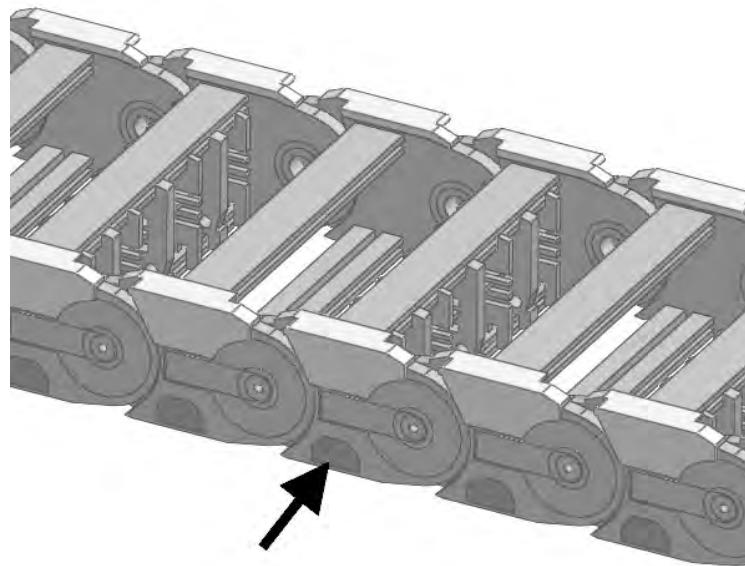

Inspecting the cables

Action	Illustration/Note
1 Move the carriage to one end and open the covers on the outside bend.	
2 Check that the cables are in the neutral axis (center line of the link) of the chain as shown in the figure. If cables are found to be too loose or too tight then they need to be adjusted.	 xx1200000518
3 Repeat the check of the cables in the neutral axis with the carriage in the middle and at the other end.	
4 Make an overall inspection of the cables. If a cable is found to corkscrew it needs to be replaced immediately. If cables have worn through the outer cover they must be replaced. Some dust can be expected from the cables as they rub against the dividers in the chain.	

Continues on next page

Location of the glide shoes

The figure shows the location of the glide shoes on the cable chain.

xx1400002683

Inspecting the glide shoes

Action	Illustration/Note
<p>1 Check the thickness of the glide shoes. If it is less than 1.5 mm the glide shoes must be replaced.</p> <p>Normally only the glide shoes in the area that make first contact when the chain transitions into gliding mode need to be checked. However due to process cycle variation in factories it is recommended to check all the glide shoes for the first inspection and note the point of wear for the next inspection.</p>	
<p>2 Make an overall inspection of the glide shoes. Replace broken or missing shoes.</p>	See Refitting the glide shoes on page 254 .

Inspecting the strapping

Action	Illustration/Note
<p>1 Check that strapping is in place. Each cable is required to be individually strapped down, and not bunched together.</p> <p>If insufficient holes are available in the connection plates for individual strapping with cable ties, the cables should be secured in such a way that they cannot move.</p> <p>Only use heavy duty cable ties, specified in Required equipment on page 169. If strapping has been replaced ensure that a paint pen is used to mark both sides of the cable tie.</p>	

Continues on next page

3 Maintenance

3.5.1 Inspecting the cable chain

Continued

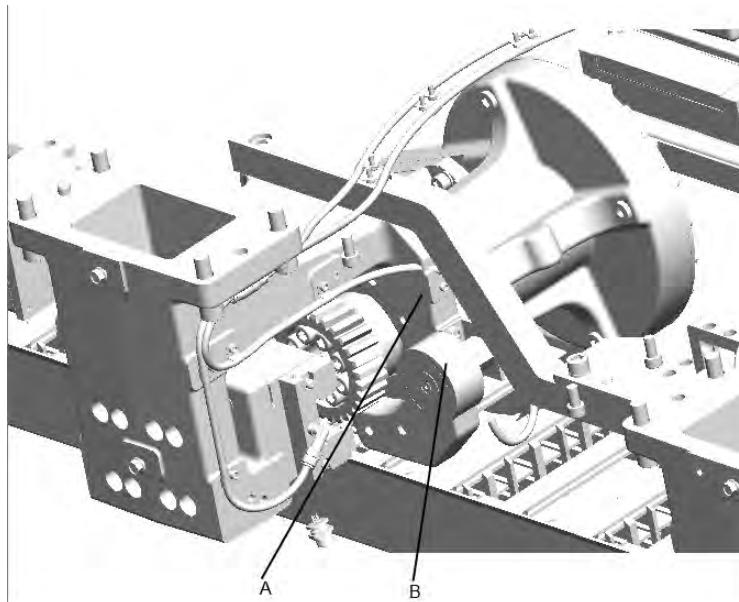

Inspecting the fasteners

	Action	Illustration/Note
1	Check bolts and screws on the attaching plates and brackets. If found to be loose they need to be removed, have locking liquid applied to them and then be refitted and tightened.	Loctite 243

3.5.2 Inspecting the felt gear

Location of felt gear

The felt gear is located as shown in figure.

xx1400002641

A	Gearbox
B	Felt gear

Required equipment

Equipment	Art. No.	Note
Standard toolkit	-	Content is defined in section Standard tools on page 276 .

Inspecting the felt gear

	Action	Illustration/Note
1	Inspect the felt gear. If damaged, replace it. See Replacing the felt gear on page 235 .	

3 Maintenance

3.6.1 Inspecting the cables and connectors

3.6 Activities 12 months

3.6.1 Inspecting the cables and connectors

Required equipment

Equipment	Art. No.	Note
Visual inspection	-	

Inspecting the connectors

Use this procedure to check the connectors.

	Action	Illustration/Note
1	Check that the connectors at the robot base, track motor and interchange to the floor cable are correctly fitted and that there is no risk of loose connections.	

Inspecting the cables

Use this procedure to check the cables.

	Action	Illustration/Note
1	Check if any cables have been damaged through wear or pinching. If damaged then replace the cable.	
2	Check if any cables rub against sharp edges. If so, route the cable so that it runs freely.	See cable routing in <i>Replacing the cables on page 255</i> .
3	Check strain relief of cables and hoses. Marking should be close to the corresponding strap. If not, pull the hose/cable to the correct position and strap it.	

Fault finding

The following information is provided to assist fault finding.

Cables that have failed due to incorrect installation typically show the following symptoms:

- Knotting of conductors underneath the cable jacket.
- Cables twist around one another within a cable carriage system.
- Cables are sticking out between the cable carriage crossbars and getting caught in the bend radius.
- Cables entangled with other cables and crossbars tearing them apart.
- Loss of conductivity through simple breaking of cable conductors.

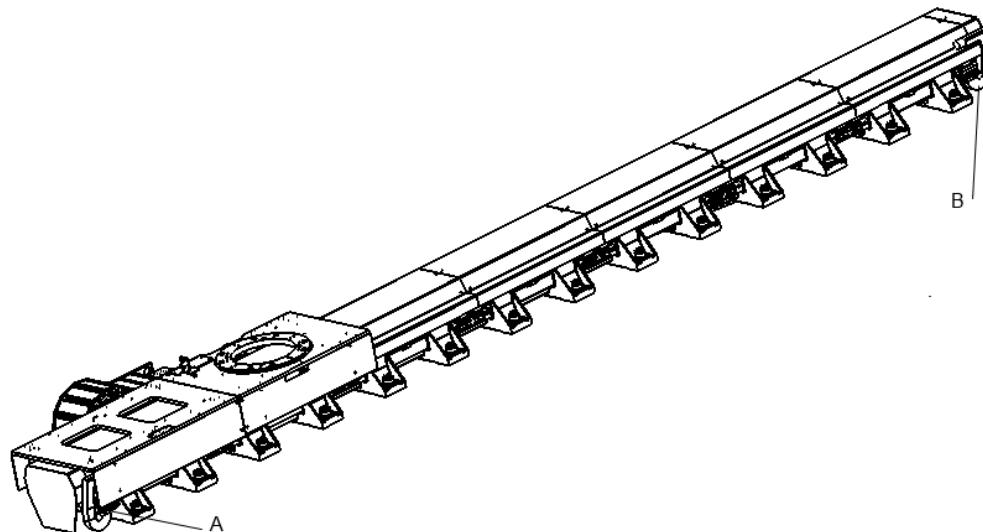

Common causes of cable failure when operating in a cable chain:

- Cables used are not designed for use in continuous flexing operation.
- Cables are packed too tight inside the carriage cavities.
- Cables are not properly adjusted (see *Inspection of cables and covers prior to start-up on page 129*).

3.6.2 Inspecting the mechanical stops

Location of mechanical stops

The mechanical stops are located as shown in figure.

xx1400001282

A	Mechanical stops left
B	Mechanical stops right

Required equipment

Equipment	Art. No.	Note
Visual inspection	-	

Inspecting the mechanical stops

Use this procedure to inspect the mechanical stops.

	Action	Illustration/Note
1	Visually inspect the bumpers on mechanical stops for damage.	 xx1400001283 A Bumper B Mechanical stop
2	If the mechanical stops are damaged, replace them.	

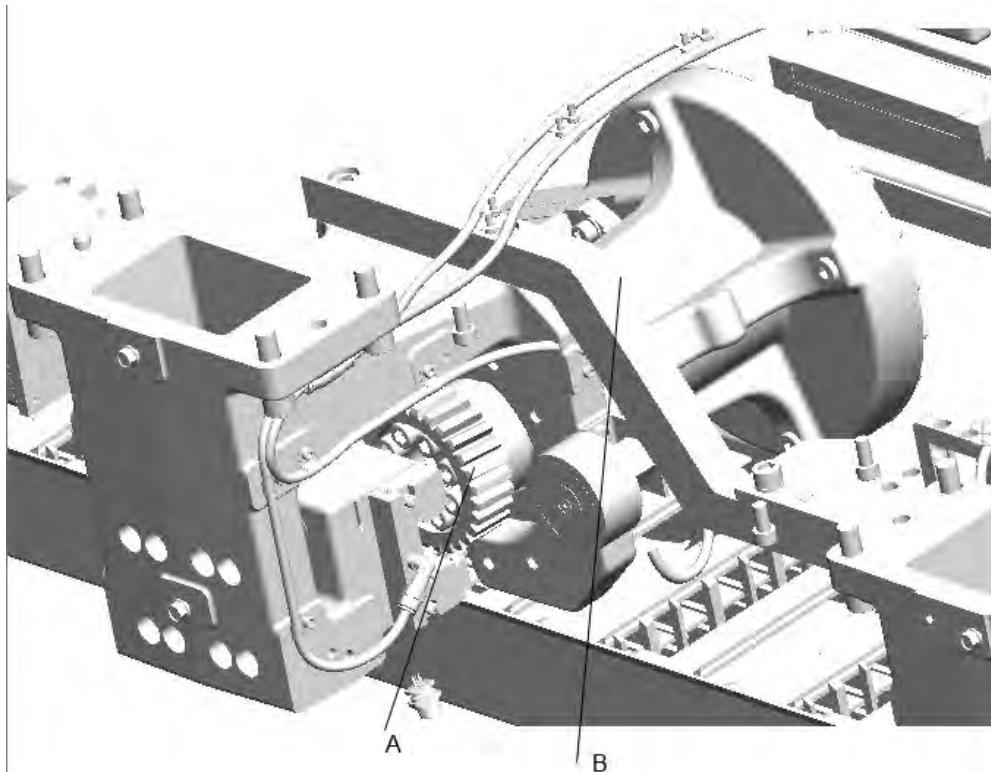

3 Maintenance

3.6.3 Inspecting the gear wheel, gearbox and backlash

3.6.3 Inspecting the gear wheel, gearbox and backlash

Location of gear wheel and gearbox

The gear wheel and gearbox are located as shown in figure.

Inspecting the tightening torque of screws

Use this procedure to inspect the tightening torque of the eight M10x40 hex socket head cap screws.

	Action	Illustration>Note
1	Remove the necessary track covers and carriage side covers.	
2	Use a torque wrench to check that the tightening torque of the screws that secure the gear to the bracket is 70 Nm.	Screw specification: M10x40 hexagon socket head cap screw, class 12.9

3 Maintenance

3.6.4 Adjusting the leveling

3.6.4 Adjusting the leveling

Adjusting the leveling

Follow the procedure in [*Geometric alignment of track motion IRBT 2005 on page 103*](#) to adjust the leveling on the track.

4 Repair

4.1 Introduction

Structure of this chapter

This chapter describes all repair activities recommended for the IRBT 2005 and any external unit.

It is made up of separate procedures, each describing a specific repair activity. Each procedure contains all the information required to perform the activity, for example spare parts numbers, required special tools, and materials.

WARNING

Repair activities not described in this chapter must only be carried out by ABB. Otherwise damage to the mechanics and electronics may occur.

Required equipment

The details of the equipment required to perform a specific repair activity are listed in the respective procedures.

The details of equipment are also available in different lists in the chapter [Reference information on page 269](#).

Safety information

There are general safety information and specific safety information. The specific safety information describes the danger and safety risks while performing specific steps in a procedure. Make sure to read through the chapter [Safety on page 15](#) before commencing any service work.

Note

If the IRBT 2005 is connected to power, always make sure that the IRBT 2005 is connected to earth before starting any repair work.

For more information see:

- *Product manual - IRC5*

CAUTION

Do not step on the cable chain or top cover; otherwise, injure and/or damage to the product may occur.

4.9.1 Replacing the cable chain

Continued

Action	Illustration/Note
9 Connect fixing side cabling and hoses with floor cables.	

Test run

Action	Illustration/Note
1 Switch on the power.	
2 Run a few strokes in jogging mode and check that the chain is gliding properly upon itself and is correctly adjusted sideways.	
3 Run the system at low speed and insure that everything runs freely and smoothly without the chain, cables and/or hoses binding.	
4 Adjust the chain position or alignment, if needed.	
5 Adjust the position and length of cables and/or hoses, if needed.	
6 If adjustments are made, repeat steps 3 to 5.	
7 Tighten all screws.	
8 The track is now ready to be powered up to full speed and duty cycle. Check the tightening torque on fastening screws after 500 cycles. Adjust, if needed. The use of serrated lock washers, snap rings and other locking means is not permitted in this part of the track.	

Moving back the carriage

Action	Illustration/Note
1 Move back the carriage and secure it to the drive train bracket with the screws.	
2 Refit the brake release unit and strap the brake release cables to the carriage.	
3 Refit the covers.	See Fitting covers on page 96 .
4 Mark the cables with a paint pen on both sides of the strapping.	
5  DANGER Make sure all safety requirements are met when performing the first test run. These are further detailed in the section DANGER - First test run may cause injury or damage! on page 46 .	
6 Perform a test run before powering up the track to full speed and duty cycle.	See Test run on page 260 .

Continues on next page

Adjusting the cable tray for spare part chains that are longer than the original

Chains longer than the original chain can be installed on single carriage tracks. In order to do this the fixed point of the chain will need to be moved, to allow for the extra length. Ensure that the replacement chain is not longer than twice the track length.

Principle of creating more space for a longer cable chain

The cable chain is fastened to the fixing connector at the middle of the cable tray. By moving the fixing connector forwards, and thereby moving the fixed point forwards, more space is created in the cable tray to suit for a longer cable chain.

More brackets and sheet metals may need to be swapped around if the chain is excessively long.

Adjusting the cable tray

	Action	Illustration/Note
1	Remove the old cable chain.	See Removing the cable chain on page 244 .
2	Fit the new cable chain to the cable tray.	See Lifting cable chain on page 67 .
3	Attach the cable chain at both the fixed and moving end.	
4	Move the carriage back and forth to both mechanical stops to ensure the chain is the correct length.	
5	Complete the installation of the new cable chain.	See Refitting the cable chain on page 247 .

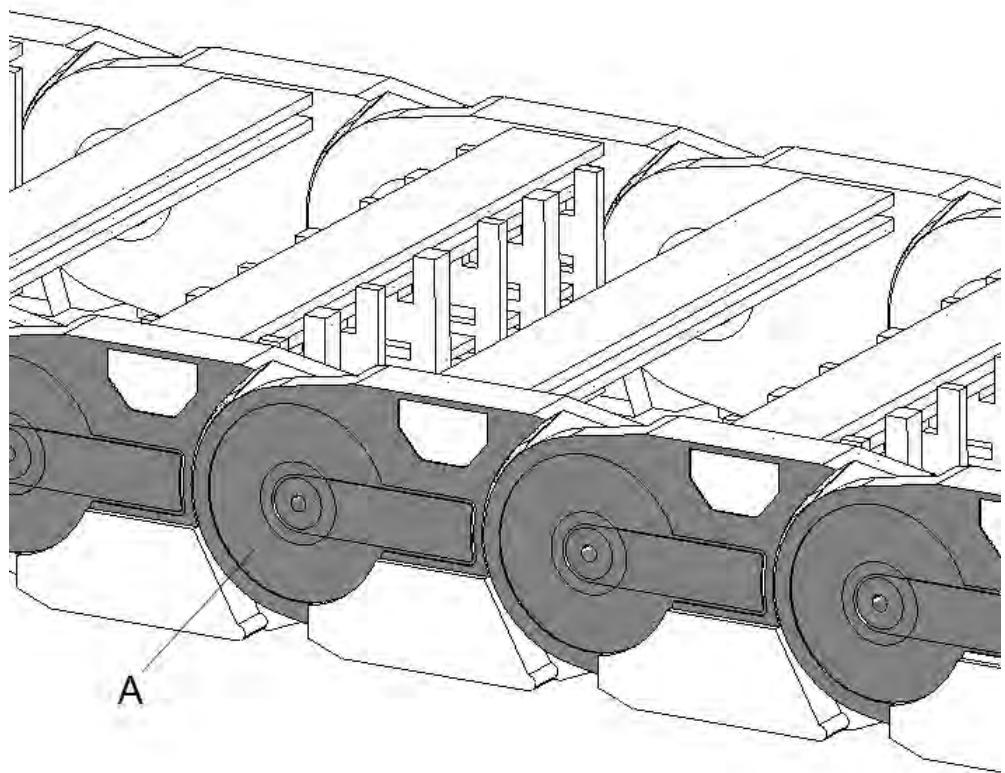

4 Repair

4.9.2 Replacing the side links and glide shoes

Continued

Action	Illustration/Note
2 Separate the two links by inserting a screwdriver and pushing down until the links separate.	 xx1300000940

Refitting the side link

Action	Illustration/Note
1 Position the links so that the two marks on the side line up. Press the links together until they snap together.	 xx1300000941
2 Rotate the link to "close" it.	 xx1300000942

Refitting the glide shoes

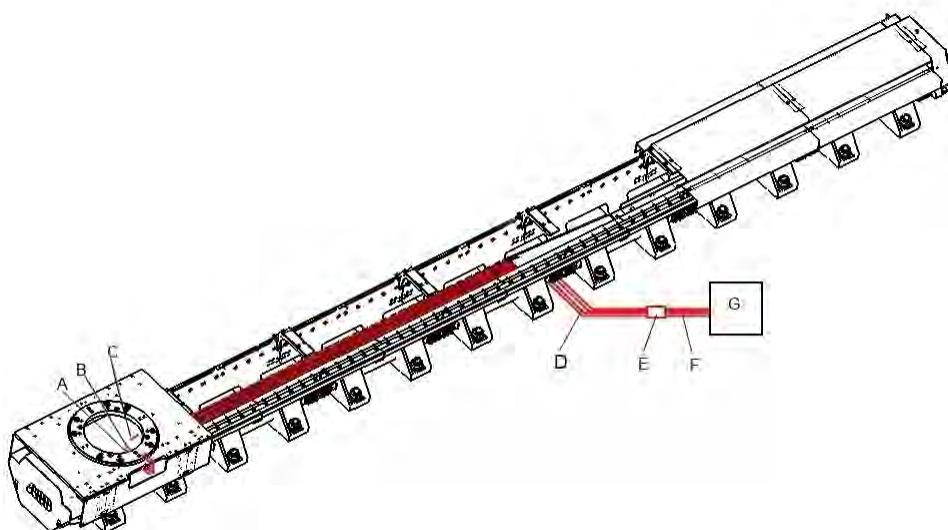

Action	Illustration/Note
1 Remove the glide shoes by pushing in the clips with a screwdriver and then pulling out the glide shoes.	
2 Refit the glide shoes by pushing it into place until it snaps.	

4.9.3 Replacing the cables

Location of cables

Cable layout, robot track

The following illustration is based on the robot track.

xx1400001286

A	Robot or conveyor power cable
B	Signal cables
C	IRBT Power cables
D	Flexible cable harness from the carriage <ul style="list-style-type: none"> • Power cables for track, robot or lifter etc. (A,C, etc.) • Motor, manipulator signal cables (B) • Other cables: hoses etc.
E	Connectors connecting cable harness from the carriage and cable harness from the controller. ⁱ
F	Floor cables from the controller <ul style="list-style-type: none"> • Power cable, available for IRC5 • Signal cable, available for IRC5
G	Controller, available for IRC5

ⁱ For transfer application, this would be a SMB box.

Cable layout, transfer track

Cable layout in the transfer track is similar with the robot track. Robot power and signal cables are replaced by transfer track power and signal cables. Flexible cables are connected with floor cables by an SMB box.

Cable layout, extra plate

Cable layout in the track with extra plate is similar with the robot track. While more extra plate-related cables are added and routed through cable chain.

4.9.3 Replacing the cables

Continued

Refitting the cable

Note

Correct placement of cables in the cable chain is vital and will prevent unnecessary wear of the cables. Also the following matters must be considered:

- Keep unlike components apart, that is separate power and signals.
- Keep unlike cable or hose jacket materials apart.
- Only put cables of similar size in the same compartments.
- Do not remove dividers.
- If replacing a cable, check that other cables are in good condition and that they are not twisted.
- Do not pack the cables too tight inside the carriage cavities.

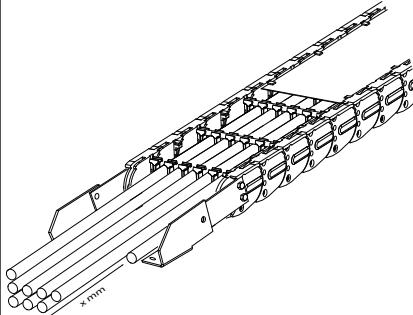

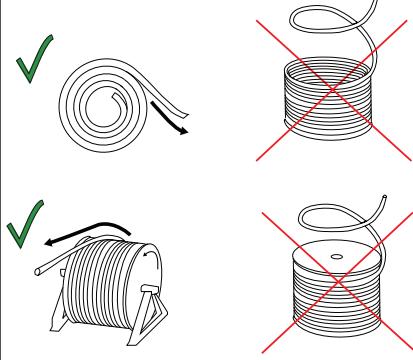

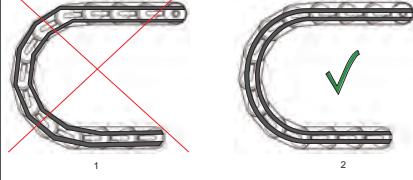

CAUTION

Adding cables that are not covered in the standard layouts could seriously reduce the expected component life of the chain.

	Action	Illustration/Note
1	Strap the connectors together, in order to facilitate insertion of them under the carriage.	
2	Fold the cable chain and insert the moving end under the carriage to its support plate at the drive unit. In the same time, guide the connectors through the cable outlet at the side of the carriage.	
3	Fit the moving end of the cable chain to the connecting plate with four screws and washers.	
4	Refit the upper part of the cable tray to the cable outlet if it is dismantled.	
5	Reconnect the motor cables.	

Continues on next page

4.9.3 Replacing the cables Continued

	Action	Illustration/Note
6	<p>Fit the new cable(s), use the same length projecting from the cable chain as for the damaged cable.</p>	 <p>xx1100000785</p> <p>See placement of all cables in Location of cables on page 255.</p> <p> Note</p> <p>When installing cables or hoses into the carriage system, they should be laid into the carriage without twist. Cables or hoses should not be simply pulled off the reel. Instead, they should be properly uncoiled as shown in the figure below.</p>  <p>xx1200000517</p>
7	<p>Check that all cable(s) and/or hose(s) are not installed too tight or too loose inside the carriage system when clamping them into place. Optimally, aim for the neutral axis (center line of the link) of the chain as shown in the figure. To ensure that the cables are in the neutral axis, move the carriage to one end and open the links in the bend of the chain. Adjust cable length as necessary, move the carriage to the opposite side and recheck.</p>	 <p>xx1200000518</p> <p>Wrong: If cables bend radius is too big or installed incorrectly it forces the cable to push against the inner or outer sides of the chain.</p> <p>Right: if correctly installed the cable should fit comfortably in the chains cavity</p>

5 Calibration

5.1 Overview

General

This chapter includes general information about different calibration methods and also details procedures that do not require specific calibration equipment.

When the robot system must be recalibrated, it is done according to the documentation enclosed with the calibration tools.

WARNING

Make sure no persons are on IRBT 2005 when the carriage is in motion. Also make sure that IRBT 2005's cover plates are free from loose objects, otherwise they can get trapped between the carriage and the plates.

Note

IRBT 2005 does not need to be calibrated during restart. The resolvers only need to be calibrated when commissioning the system.

When to calibrate

The system must be calibrated if any of the following situations occur.

The resolver values are changed

If resolver values are changed, the robot must be recalibrated using the calibration methods supplied by ABB. Calibrate the track carefully with standard calibration.

The resolver values will change when parts affecting the calibration position are replaced on the track, for example motors or parts of the transmission.

This is detailed in [Fine calibration on page 264](#).

The revolution counter memory is lost

If the revolution counter memory is lost, the counters must be updated. See [Update revolution counters on page 265](#). This will occur when:

- The battery is discharged
- A resolver error occurs
- The signal between a resolver and measurement board is interrupted
- A robot axis is moved with the control system disconnected

The revolution counters must also be updated after the robot and controller are connected at the first installation.

The track is rebuilt

If the track is rebuilt, for example after a crash or when the reach ability of the track is changed, it needs to be recalibrated for new resolver values.

This is detailed in [Fine calibration on page 264](#).

5 Calibration

5.2 Fine calibration

5.2 Fine calibration

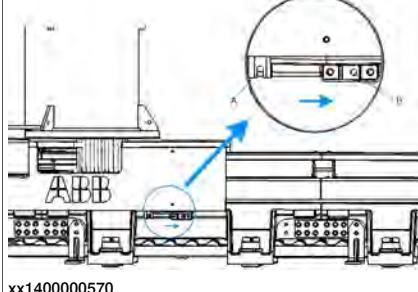

General

This procedure must be applied at the first start or after mechanical intervention (motor change, gearbox).

Required equipment

Equipment	Art. No.	Note
Calibration tool	3HAC054533-001	Ø8 calibration pin

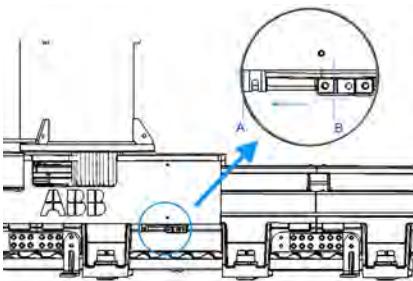

Fine calibrating

	Action	Illustration/Note
1	Using the FlexPendant, jog the carriage close to the calibration gauge position.	
2	Move the track until the calibration notch on the carriage line up with the calibration hole on the section.	 A: Calibration notch on the carriage B: Calibration hole on the section
3	Insert the calibration pin. A dowel pin diameter 8mm can also be used.	
4	Tap ABB on the top left of the FlexPendant.	
5	Tap Calibration .	
6	Select the desired mechanical unit.	
7	Tap Fine calibration .	
8	Select the desired axis.	
9	Tap Calibrate .	

5.3 Update revolution counters

Procedure

This procedure must be applied if revolution counter value is loss for the track.

	Action	Illustration/Note
1	Align the sharp edge of the moving part of the calibration marker with the line of the fixed part calibration marker.	 <p>A: Calibration sharp edge of the moving part B: Calibration sharp edge of the fixed part</p>
2	Tap ABB on the top left of the FlexPendant.	
3	Tap Calibration.	
4	Select the desired mechanical unit.	
5	Tap Update revolution counters.	
6	Select the desired axis.	
7	Tap Update.	

5.4 Defining base frame

General

To run coordinated axes, the base frame must be defined. See *Application manual - Additional axes and stand alone controller (Coordinated track motion)*.

6 Decommissioning

6.1 Environmental information

Hazardous material

The table specifies some of the materials in the product and their respective use throughout the product.

Dispose components properly to prevent health or environmental hazards.

Material	Example application
Batteries, NiCad or Lithium	Serial measurement board
Copper	Cables, motors
Cast iron/nodular iron	Track section
Steel	Gears, screws, base frame, and so on.
Neodymium	Brakes, motors
Plastic/rubber	Cables, connectors, drive belts, and so on.
Oil, grease	Gearbox
Aluminium	Covers

Oil and grease

Where possible, arrange for oil and grease to be recycled. Dispose of via an authorized person/contractor in accordance with local regulations. Do not dispose of oil and grease near lakes, ponds, ditches, down drains, or onto soil. Incineration must be carried out under controlled conditions in accordance with local regulations.

Also note that:

- Spills can form a film on water surfaces causing damage to organisms. Oxygen transfer could also be impaired.
- Spillage can penetrate the soil causing ground water contamination.

Quantity	Units		
Length	1 m	3.28 ft.	39.37 in
Weight	1 kg	2.21 lb.	
Weight	1 g	0.035 ounces	
Pressure	1 bar	100 kPa	14.5 psi
Force	1 N	0.225 lbf	
Moment	1 Nm	0.738 lbf-ft	
Volume	1 L	0.264 US gal	

7.4 Screw joints

General

This section describes how to tighten the various types of screw joints on the IRBT 2005.

The instructions and torque values are valid for screw joints comprised of metallic materials and do *not* apply to soft or brittle materials.

UNBRAKO screws

UNBRAKO is a special type of screw recommended by ABB for certain screw joints. It features special surface treatment (Gleitmo as described below) and is extremely resistant to fatigue.

Whenever used, this is specified in the instructions, and in such cases, *no other type of replacement screw* is allowed. Using other types of screws will void any warranty and may potentially cause serious damage or injury.

Gleitmo treated screws

Gleitmo is a special surface treatment to reduce the friction when tightening the screw joint. Screws treated with Gleitmo may be reused 3-4 times before the coating disappears. After this the screw must be discarded and replaced with a new one.

When handling screws treated with Gleitmo, protective gloves of **nitrile rubber** type should be used.

Screws lubricated in other ways

Screws lubricated with Molycote 1000 should *only* be used when specified in the repair, maintenance or installation procedure descriptions.

In such cases, proceed as follows:

- 1 Apply lubricant to the screw thread.
- 2 Apply lubricant between the plain washer and screw head.
- 3 Screw dimensions of M8 or larger must be tightened with a torque wrench. Screw dimensions of M6 or smaller may be tightened without a torque wrench if this is done by trained and qualified personnel.

Lubricant	Article number
Molycote 1000 (molybdenum disulphide grease)	11712016-618

Tightening torque

Before tightening any screw, note the following:

- Determine whether a **standard** tightening torque or **special** torque is to be applied. The **standard** torques are specified in the following tables. Any **special** torques are specified in the repair, maintenance or installation procedure descriptions. **Any special torque specified overrides the standard torque!**
- Use the *correct* tightening torque for each type of screw joint.
- Only use *correctly calibrated* torque keys.

Continues on next page

7 Reference information

7.4 Screw joints

Continued

- Always *tighten the joint by hand*, and never use pneumatic tools.
- Use the *correct tightening technique*, that is *do not jerk*. Tighten the screw in a slow, flowing motion.
- Maximum allowed total deviation from the specified value is 10%!

Oil-lubricated screws with slotted or cross-recess head screws

The following table specifies the recommended standard tightening torque for *oil-lubricated screws with slotted or cross-recess head screws*. Any special torque specified in the repair, maintenance or installation procedure overrides the standard torque!

Oil-lubricated screws with allen head screws

The following table specifies the recommended standard tightening torque for *oil-lubricated screws with allen head screws*. Any special torque specified in the repair, maintenance or installation procedure overrides the standard torque!

Dimension	Tightening torque (Nm) Class 8.8, oil-lubricated	Tightening torque (Nm) Class 10.9, oil-lubricated	Tightening torque (Nm) Class 12.9, oil-lubricated

7.5 Standard tools

7.5 Standard tools

General

All service (repairs, maintenance, and installation) procedures contains lists of tools required to perform the specified activity.

All special tools required are listed directly in the procedures while all the tools that are considered standard are gathered in the standard toolkit and defined in the following table.

This way, the tools required are the sum of the standard toolkit and any tools listed in the instruction.

Contents, standard tools

Qty	Tool
1	Ring-open-end spanner 8-19 mm
1	Socket head cap 2.5-17 mm
1	Torx socket no: 20-60
1	Torque wrench 10-120 Nm
1	Ratchet head for torque wrench 1/2
1	Hex bit socket head cap no. 5 socket 1/2", bit length=20 mm
1	Hex bit socket head cap no. 6 socket 1/2", bit length=20 mm
1	Hex bit socket head cap no. 8 socket 1/2", bit length=20 mm
1	Plastic mallet
1	Small screwdriver

7.6 Special tools

Extra toolkit

All service instructions contain lists of tools required to perform the specified activity. The required tools are a sum of standard tools defined in the section [Standard tools on page 276](#) and special tools listed directly in the instructions and also gathered in this section.

Special tools

Qty	Tool	Art. No.	Note
1	Backlash adjustment tool	3HAC054528-001	
1	Calibration pin	3HAC054533-001	
1	Companion rack	3HAC054532-001	
1	Companion rack fix block	3HAC054531-001	
1	Laser tracker	3HAW107700357	
1	Leveling tool	3HAC054535-001	
1	Locking nut adjustment tool	3HAC054534-001	
2	Rack clamp		The actual rack clamp to be used should be prepared based on actual situation.

7 Reference information

7.7 Lifting accessories and lifting instructions

General

Many repair and maintenance activities require different pieces of lifting accessories, which are specified in each procedure.

The use of each piece of lifting accessories is *not* detailed in the activity procedure, but in the instruction delivered with each piece of lifting accessories.

This implies that the instructions delivered with the lifting accessories should be stored for later reference.

7.8 HILTI adhesive anchor

Overview

HVU with HAS/HAS-E rod adhesive anchor

Mortar system	Benefits
  	<ul style="list-style-type: none"> - suitable for non-cracked concrete C 20/25 to C 50/60 - high loading capacity - suitable for dry and water saturated concrete - large diameter applications - high corrosion resistant

xx1400000489

Basic data (for a single anchor)

All data in this section applies to:

- Correct setting (See setting instruction)
- No edge distance and spacing influence
- Steel failure
- Base material thickness, as specified in the table
- One typical embedment depth, as specified in the table
- One anchor material, as specified in the tables
- Concrete C 20/25, $f_{ck,cube} = 25 \text{ N/mm}^2$
- Temperate range I (min. base material temperature -40°C, max. long term/short term base material temperature: +24°C/40°C)
- Installation temperature range -5°C to +40°C

M16 anchor	
Typical embedment depth [mm] ⁱ	125
Base material thickness [mm]	210
Carbon steel, strength class	5.8
Mean ultimate resistance: concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$, anchor HAS Tensile NR _{u,m} HAS [kN]	75,6
Mean ultimate resistance: concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$, anchor HAS Shear VR _{u,m} HAS [kN]	37,8
Characteristic resistance: concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$, anchor HAS Tensile NR _k HAS [kN]	60,0
Design resistance: concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$, anchor HAS Shear VR _k HAS [kN]	36,0
Recommended loads ⁱⁱ : concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$, anchor HAS Tensile NR _d HAS [kN]	40,0

M16 anchor	
Recommended loads: concrete C 20/25 – $f_{ck,cube} = 25 \text{ N/mm}^2$, anchor HAS Shear VRd HAS [kN]	28,8

- i The allowed range of embedment depth is shown in the setting details. The corresponding load values can be calculated according to the simplified design method.
- ii With overall partial safety factor for action = 1,4. The partial safety factors for action depend on the type of loading and shall be taken from national regulations.

Basic design tensile resistance

Design steel resistance $N_{Rd,s}$

Anchor size	Data according ETA-05/0255, issue 2011-06-23							
	M8	M10	M12	M16	M20	M24	M27	M30
$N_{Rd,s}$	HAS-(E)(F) 5,8 [kN]	11,3	17,3	25,3	48,0	74,7	106,7	-
	HAS-(E)(F) 8,8 [kN]	18,0	28,0	40,7	76,7	119,3	170,7	231,3
	HAS-(E)-R [kN]	12,3	19,8	28,3	54,0	84,0	119,8	75,9
	HAS-(E)-HCR [kN]	18,0	28,0	40,7	76,7	119,3	106,7	-

Design combined pull-out and concrete cone resistance $N_{Rd,p} = N_{Rd,p}^0 \cdot f_{B,p} \cdot f_{h,p}$

Anchor size	Data according ETA-05/0255, issue 2011-06-23							
	M8	M10	M12	M16	M20	M24	M27	M30
Typical embedment depth $h_{ef,typ}$ [mm]	80	90	110	125	170	200	210	270
$N_{Rd,p}^0$ Temperature range I [kN]	16,7	23,3	33,3	40,0	76,7	93,3	133,3	166,7
$N_{Rd,p}^0$ Temperature range II [kN]	13,3	16,7	26,7	33,3	50,0	76,7	93,3	113,3

Service temperature range

Hilti HVU adhesive may be applied in the temperature ranges given below. An elevated base material temperature may lead to a reduction of the design bond resistance.

Temperature range	Base material temperature	Maximum long term base material temperature ⁱ	Maximum short term base material temperature ⁱⁱ
Temperature range 1	-40 °C to +40 °C	+24 °C	+40 °C
Temperature range 2	-40 °C to +80 °C	+50 °C	+80 °C
Temperature range 3	-40 °C to +120 °C	+72 °C	+120 °C

- i Long-term elevated base material temperatures are roughly constant over significant periods of time.
- ii Short-term elevated base material temperatures are those that occur over brief intervals, e.g. as a result of diurnal cycling.

Installation

Dry and water-saturated concrete, hammer drilling

xx1400000487

For detailed information on installation see instruction for use given with the package of the product.

For technical data for anchors in diamond drilled holes contact the Hilti Technical advisory service.

Curing time for general conditions

Temperature of the base material	Curing time before anchor can be fully loaded
20 °C to 40 °C	20 minutes
10 °C to 19 °C	30 minutes
0 °C to 9 °C	1 hour
-5 °C to -1 °C	5 hour
